EXECUTIVE SUMMARY

Despite a historical mission of social mobility for meritorious state residents, public research universities increasingly enroll an affluent student body that is unrepresentative of the socioeconomic and racial diversity of the states they serve. Mainstream policy debates about the causes of access inequality focus on “deficiencies” of students and K-12 schools (e.g., the “achievement gap,” “under-matching”). Public universities position themselves as remaining committed to access despite state funding cuts and despite student deficiencies, pointing to the adoption of access-oriented policies (e.g., need-based financial aid, outreach programs) as evidence of this commitment. In turn, policy discourse assumes that doubling the number of high-achieving, under-represented students who apply to a university will double their enrollment. Therefore, policy interventions to increase college access tend to focus on changing student behavior rather than university behavior.

An alternative explanation for access inequality is that the enrollment priorities of some public research universities are biased against poor students and/or communities of color. Decades of research on organizational behavior finds that formal policy adoption is often a ceremonial effort to appease external stakeholders, while internal resource allocation is a reliable indicator of organizational priorities, suggesting a “trust but verify” approach to university rhetoric about access. Scholarship on “enrollment management” shows that universities are very purposeful about which students they pursue and expend substantial resources crafting their class. Therefore, knowing which student populations are targeted by university recruiting efforts can yield insights about university enrollment priorities.

This report analyzes off-campus recruiting visits (e.g., visit to a local high school) by 15 public research universities as a means of understanding university enrollment priorities. We collected data on recruiting visits by “scraping” data from university admissions websites (e.g., webpages advertising admissions representatives coming to a “neighborhood near you”) and by issuing public records requests.

Findings

Out-of-state recruiting

- ▷ **Most public research universities prioritize recruiting out-of-state students rather than students from their home state.** 12 of 15 universities made more out-of-state visits than in-state visits and 7 of 15 universities made more than twice as many out-of-state visits than in-state visits.

- ▷ Out-of-state visits are concentrated in affluent communities within major metropolitan areas, ignoring rural communities.
- ▷ All universities were much more likely to visit out-of-state public high schools in high-income communities than schools in low-income communities, even after controlling for factors related to recruiting visits such as enrollment size and student achievement.
- ▷ Most universities were significantly less likely to visit out-of-state public high schools with a high percentage of Black, Latinx, and Native American students, even after controlling for other factors.
- ▷ Most universities visit a disproportionate number of out-of-state private schools.

In-state recruiting

- ▷ "Coverage" of in-state public high schools and community colleges varied dramatically across universities, even after considering state size and population (e.g., University of Nebraska visited 88% of high schools while University of Alabama visited 33%).
- ▷ Most universities were more likely to visit in-state public high schools in high-income communities than schools in low-income communities, even after controlling for other factors. However, income bias for in-state visits was smaller than income bias for out-of-state visits.
- ▷ The presence of racial bias in in-state visits to public high schools varied across universities, with some universities less likely to visit schools with a high share of Black/Latinx/Native students and other universities more likely to visit schools with a high share of Black/Latinx/Native students.

Overall patterns

- ▷ **Recruiting patterns are clearly tied to state funding.** Universities with weak state funding (e.g., University of Alabama, University of South Carolina) tended to make more out-of-state visits, fewer in-state visits, and exhibit socioeconomic and/or racial bias in in-state visits.
- ▷ However, universities facing similar state funding and demographic trends (e.g., UC Berkeley and UC Irvine) often exhibited substantially different recruiting patterns with respect to out-of-state focus, income bias, and racial bias. Therefore, **university enrollment priorities are choices made by leadership rather than mere functions of environmental conditions.**

Summary and implications. In contrast to rhetoric from university leaders, our findings suggest strong socioeconomic and racial biases in the enrollment priorities of many public research universities. A small number of universities exhibit recruiting patterns broadly consistent with the historical mission of social mobility for meritorious state residents. However, most universities concentrated recruiting visits in wealthy, out-of-state communities while also privileging affluent schools in in-state visits. Although most universities did not exhibit racial bias in in-state visits, out-of-state visits consistently exhibited racial bias. Since most universities made many more out-of-state visits than in-state visits, overall recruiting visit patterns for most universities contribute to a student composition where low-income students of color feel increasingly isolated amongst growing cohorts of affluent, predominantly White, out-of-state students.

These recruiting patterns are a function of university enrollment priorities. In turn, these enrollment priorities are a function of a broken system of state higher education finance, which incentivizes universities to prioritize rich out-of-state students with lack-luster academic achievement. This is not a meritocracy. We suggest recommendations to policymakers, access advocates, and university leaders to reverse this vicious cycle.

- ▷ **State policymakers.** Universities make up for state budget cuts by prioritizing affluent students. If state policymakers want flagship public universities to prioritize meritorious state residents, they must re-invest in public higher education by growing state appropriations and/or by boosting the purchasing power of poor students through growth in need-based grant aid.
- ▷ **Access advocates.** Advocates for access can use our research to start a dialogue with university leaders about the disconnect between stated commitments and actual enrollment priorities. Armed with systematic data about university recruiting behavior, access advocates will no longer be deterred by lofty rhetoric or the adoption of opaque programs with unclear resources. Therefore, the data and findings from this report enable access advocates to hold universities accountable, creating a foundation for an authentic debate about university priorities.
- ▷ **University leaders.** Research shows that generous need-based financial aid combined with aggressive outreach dramatically increases the number of high-achieving, low-income students who apply to and attend public research universities. Therefore, access inequality is not simply a consequence of student deficiencies, but rather a deficit of will by universities. University leaders serious about access for under-represented students must put their money where their mouth is, rather than putting their money where the money is.

INTRODUCTION

The University of Alabama-Tuscaloosa exemplifies that transformation from state flagship university to out-of-state flagship. Nonresident freshman enrollment exploded from 626 in 2002-03, to 1,895 in 2008-09, and to 5,001 by 2017-18, while resident freshmen declined from 3,221 in 2008-09 to 2,406 by 2017-18 (Author calculations based on IPEDS data). This period also witnessed the erosion of state appropriations, which declined from \$232 million in 2007-08 to \$149 million in 2010-11, increasing only modestly to \$158 million by 2016-17 despite years of economic recovery following the Great Recession (2018 CPI). By contrast, net tuition revenue increased dramatically – driven by nonresident enrollment growth – from \$105 million in 2002-03 to \$225 million by 2007-08 to \$493 million by 2016-17.

Nonresident enrollment growth at the University of Alabama also coincided with declining socioeconomic and racial diversity. The percent of full-time freshman receiving Pell Grants declined from 21.2% in 2010-11 to 17.0% in 2016-17. Additionally, while the percent of 18-24 year-olds in Alabama who identify as Black increased from 31.4% in 2010 to 32.3% in 2017, the percent of full-time freshman at the University of Alabama who identify as Black declined from 11.9% in 2010-11 to 7.5% in 2017-18.

While most research on college access focuses on student behavior, the transformation of student composition at the University of Alabama did not result from sudden, unexpected shifts in student demand. Rather, the University developed arguably the most sophisticated and extensive approach to student recruiting in public higher education. Utilizing the “data science” ex-

pertise of enrollment management consulting firms, the university identifies desirable “prospects” and plies these prospects with a targeted cocktail of emails, brochures, paid advertising (e.g., pay-per-click ads from Google), off-campus recruiting visits to “feeder” high schools, and a savvy social media campaign.

Figure 1 provides descriptive statistics about off-campus recruiting visits (e.g., visits to local high schools, community colleges, hotel receptions) by the University of Alabama in the 2017 calendar year. Admissions representatives made 4,347 off-campus recruiting visits. However, only 390 of these visits occurred in Alabama. Further, the University visited only 33% of Alabama public high schools. These in-state public high school visits were concentrated in relatively, affluent, predominantly White communities, largely avoiding high schools in Alabama’s “Black Belt,” which enroll the largest concentration of African American students. In-state recruiting efforts were dwarfed by the 3,957 out-of-state recruiting visits, which spanned metropolitan areas across the U.S. The University made 2,310 visits to out-of-state public high schools. These visits focused on schools in affluent communities, with visited schools having a much higher percent of White students than non-visited schools. Incredibly, the University made 935 visits to out-of-state private high schools, more than double the total number of in-state recruiting visits.

The University of Alabama represents an extreme case of a transformation occurring at many public research universities across the nation. Public research universities were founded to provide upward mobility for high-achieving state residents ([Haycock, Mary, & Engle, 2010](#)) and designated the unique responsibility of preparing the future professional, business, and civic leaders of the state. Quoting 19th Century

University of Michigan President James Angell, these institutions provided “an uncommon education for the common man” (as cited in [Rudolph, 1962](#), p. 279) who could not afford tuition at elite private institutions. Unfortunately, public research universities increasingly enroll an affluent student body that is unrepresentative of the socioeconomic and racial diversity of the states they serve ([Huelsman, 2018](#); [Jaquette, 2017](#); [Jaquette, Curs, & Posselt, 2016](#); [Nichols & Schak, 2019](#)). Many public research universities have dramatically increased nonresident enrollment ([Jaquette & Curs, 2015](#)) and have adopted financial aid policies that specifically target nonresident students with modest academic achievement ([Burd, 2015, 2018](#); [Des-](#)

[Jardins, 2001](#); [Leeds & DesJardins, 2015](#)). Meanwhile, many high-achieving, low-income students are funneled to community colleges ([Dillon & Smith, 2017](#)), which dramatically lower the probability of obtaining a BA ([B. T. Long & Kurlaender, 2009](#); [Mountjoy, 2018](#)). These trends raise concerns that public research universities have transformed from “engine[s] of social mobility” ([Gerald & Haycock, 2006](#), p. 3) to “engines of inequality.”

Contemporary policy debates about racial and socioeconomic inequality in college access tend to focus on the “achievement gap” and on “undermatching,” the idea that high-achieving, low-income students fail to

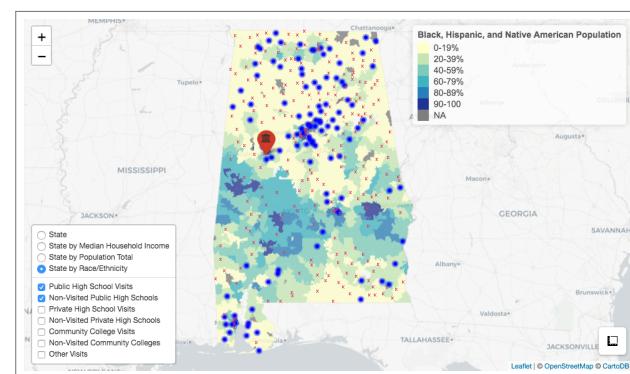

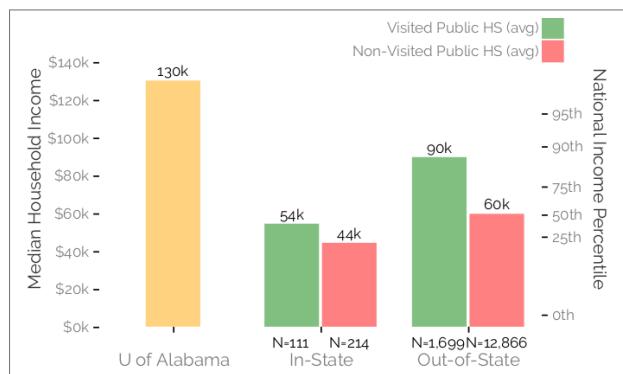

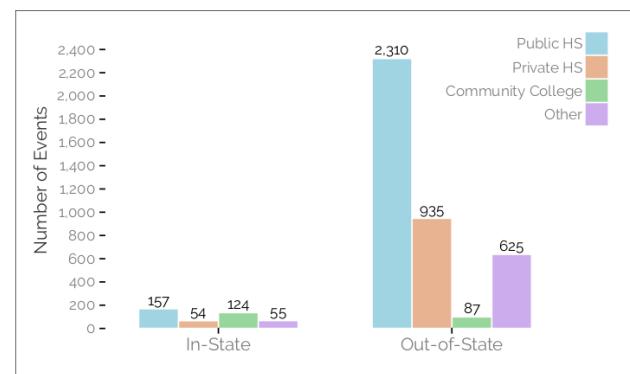

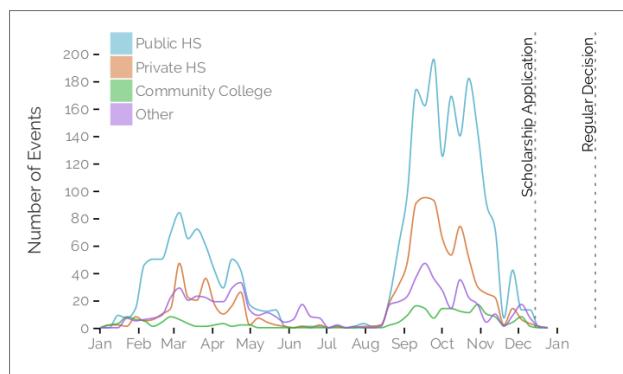

FIGURE 1: UNIVERSITY OF ALABAMA 2017 OFF-CAMPUS RECRUITING CHARACTERISTICS.

apply to good colleges because they have bad guidance at home and at school ([The White House, 2014b](#)). These explanations focus on “deficiencies” of students and K-12 schools. As such, policy interventions to increase college access mostly focus on student academic achievement and decision-making ([Page & Scott-Clayton, 2016](#)). Policy debates also highlight affordability as an important barrier to access. In recent decades, particularly following the Great Recession of 2008, states disinvested in public universities, and these state budget cuts have been associated with steep rises in tuition price.

Within this policy discourse, public research universities position themselves as progressive actors that remain committed to the access mission despite state funding cuts and despite the deficiencies of students and K-12 schools. Universities point to the adoption of policies such as holistic admissions, need-based financial aid, and outreach/pipeline programs as evidence of their commitment to access ([The White House, 2014a](#)). However, decades of research on organizational behavior shows that formal policy adoption (e.g., outreach, financial aid programs) is often a symbolic effort to appease external stakeholders rather than a substantive effort to solve the problem ([Davis, 2005](#)).

Recent trends in enrollment and funding suggest an alternative explanation for growing racial and socioeconomic inequality in access to public research universities: university enrollment priorities privilege affluent students and are biased against low-income students and communities of color. Drawing from scholarship on organizational behavior (e.g., [Meyer & Rowan, 1977](#); [Thompson, 1967](#); [Weber, Davis, & Lounsbury, 2009](#)), we argue that knowing which student populations are actually targeted by university recruiting

efforts is a more credible indicator of enrollment priorities than university rhetoric or policy adoption. In turn, scholarship that analyzes recruiting behavior as an indicator of enrollment priorities has important policy implications; if university enrollment priorities – the “supply side” of higher education – are biased against low-income students and communities of color, then policy solutions that focus solely on students and K-12 schools – the “demand side” – will fail to overcome access inequality.

Unfortunately, research on recruiting is rare because data on university recruiting behavior are difficult to obtain. This report represents the first systematic, quantitative analysis of university recruiting behavior. Specifically, we investigate off-campus recruiting visits by 15 public research universities. We collected data on recruiting visits by “scraping” the “travel schedules” of admissions officers from university admissions websites (e.g., web-pages advertising admissions representatives coming to a “neighborhood near you”) and also by issuing public records requests to public universities. We merged recruiting visit data to secondary data on high schools, community colleges, and communities in order to investigate the characteristics of schools and communities that receive visits.

This report is organized as follows. First, we provide an overview of the “enrollment management” industry and situate off-campus recruiting within the broader set of recruiting interventions employed by universities. Next, we describe research methodology and present research findings. The majority of public universities in our sample made far more out-of-state recruiting visits than in-state visits. Out-of-state visits consistently revealed dramatic income bias and strong racial bias against majority-minority schools. For most universities, in-state recruiting visits revealed signifi-

cant income bias but not racial bias. However, since most universities made many more out-of-state visits than in-state visits, overall recruiting patterns for most universities revealed bias against state residents, low-income students, and communities of color. A handful of universities (e.g., North Carolina State University) – notably those with stronger state funding – focused their recruiting efforts on in-state schools and communities and did not exhibit racial or socioeconomic biases.

Finally, we discuss implications for policymakers and university leaders, with the goal of reversing the vicious cycle of states disinvesting in public universities and public universities disinvesting in the state. State policymakers often rationalize funding cuts to public research universities on the grounds that these organizations can generate their own revenue sources ([Delaney & Doyle, 2011](#)). Policymakers concerned about access must understand that state funding cuts incentivize public research universities to prioritize affluent, out-of-state students.

Collecting concrete data on university recruiting behaviors also has important implications for university leaders. University leaders can no longer trumpet a commitment to access while simultaneously focus recruiting efforts on affluent prospects because we are releasing these data to the public. Armed with these data, internal and external constituents committed to access will not be placated by lofty rhetoric and ceremonial action. Therefore, the time is now for leaders of public research universities to resurrect the historic role as the state's preeminent engine of opportunity and social mobility.

ENROLLMENT MANAGEMENT

Understanding the relationship between university enrollment behaviors and access inequality requires a basic understanding of the enrollment management industry. Enrollment management (EM) is a profession that integrates techniques from marketing and economics in order to “influence the characteristics and the size of enrolled student bodies” ([Hossler & Bean, 1990](#), p. xiv). EM is also a university administrative structure (e.g., “The Office of Enrollment Management”) that coordinates the activities of admissions, financial aid, and marketing and recruiting.

The broader enrollment management industry consists of professionals working within universities (e.g., vice president for enrollment management, admissions counselors), the associations EM professionals belong to (e.g., National Association for College Admission Counseling), and the marketing and EM consultancies universities hire (e.g., Hobsons, Ruffalo Noel Levitz).

The enrollment funnel

Figure 2 depicts the “enrollment funnel,” a conceptual tool the EM industry uses to describe stages in student recruitment in order to inform targeted recruiting interventions. While scholarship and policy debate about college access focuses on the final stages of the enrollment funnel – when applicants are admitted (e.g., [Alon, 2009](#)) and financial aid “leveraging” is used to convert admits to enrollees (e.g., [McPherson & Schapiro, 1998](#)) – the EM industry expends substantial resources on earlier stages of the funnel. “Prospects” are “all the potential students you would want to at-

FIGURE 2: THE ENROLLMENT FUNNEL.

tract to your institution" ([Campbell, 2017](#)). "Inquiries" are prospects that contact the university. These include inquiries who respond to initial solicitation by the universities (e.g., email, brochure) and unsolicited inquiries who reach out on their own (e.g., sending SAT/ACT scores to the university, completing a form on the university admissions website). Most universities hire EM consulting firms, which utilize sophisticated, data-intensive methodologies, to help universities identify prospects, solicit inquiries, convert prospects and inquiries into applicants, etc. For example, from 2010 to 2018 the University of Alabama paid \$4.4 million to the EM consulting firm Hobsons ([University of](#)

[Alabama, 2019](#)) (2018 CPI).

Universities identify prospects primarily by purchasing "student lists" from College Board and ACT. For example, from 2010 to 2018, the University of Alabama paid \$1.9 million to College Board and \$349k to ACT, Inc ([University of Alabama, 2019](#)). Ruffalo Noel-Levitz ([2017](#)) found that the median public university purchases about 64,000 names. Student lists contain contact details and background information (demographic, socioeconomic, and academic) about individual prospects. Universities control which prospects are included in a list by selecting on criteria such as zip code, race, and academic achievement.

Once identified, prospects are plied with recruiting interventions aimed at soliciting inquiries and applications ([Clinedinst & Koranteng, 2017](#)). Non face-to-face interventions include emails, brochures, and text messages. Face-to-face interventions include on-campus visits and off-campus visits. Additionally, universities utilize paid advertising (e.g., pay-per-click ads from Google, cookie-driven ads targeting prospects who visit your website) and social media (e.g., Twitter, Instagram, YouTube) as a means of generating inquiries and creating positive "buzz" amongst prospects ([Noel-Levitz, 2016](#)). Given the rise in "stealth applicants" who do not inquire before applying ([Dupaul & Harris, 2012](#)), social media enables universities to tell their story to prospects who do not want to be contacted.

Given the focus of this report, what is the role of off-campus visits in student recruitment? In the admissions world, "travel season" refers to the mad dash between Labor Day and Thanksgiving when admissions officers host hotel receptions, college fairs, and visit high schools across the country ([Stevens, 2007](#)). Research by both EM consulting firms and by scholars

describe off-campus recruiting as a means of simultaneously identifying prospects and connecting with prospects already being targeted through mail/email (e.g., [Clinedinst & Koranteng, 2017](#); [Ruffalo Noel-Levitz, 2016](#); [Stevens, 2007](#)). With respect to efficacy, [Ruffalo Noel-Levitz \(2018\)](#) found that off-campus visits were the second highest source of inquiries (after student list purchases), accounting for 19.0% of inquiries for the median public university. Off-campus visits were also the third highest source of enrollees (after stealth applicants and on-campus visits), accounting for 16% of enrollees ([Ruffalo Noel-Levitz, 2018](#)).

Additionally, research finds that high school visits are instrumental for maintaining warm relationships with guidance counselors at “feeder schools.” [Ruffalo Noel-Levitz \(2018\)](#) found that face-to-face meetings were the most effective means of engaging high school guidance counselors. [Stevens \(2007\)](#) worked as a regional admissions recruiter for a selective liberal arts college as part of his broader ethnography on college admissions. Relationships with counselors were essential because “The College’s reputation and the quality of its applicant pool are dependent upon its connections with high schools nationwide” ([Stevens, 2007](#), p. 53). The College visited the same schools year after year because successful recruiting depends on long-term relationships with high schools. Further, the College tended to visit affluent schools, and private schools in particular, because these schools enroll high-achieving students who can afford tuition and because these schools have the resources and motivation to host a successful visit ([Stevens, 2007](#)).

[Holland \(2019\)](#) analyzed high school visits from the student perspective. High school visits influenced where students applied and where they enrolled. The strength of this finding was modest for affluent stu-

dents with college-educated parents. These students tended to be more concerned about college prestige and less influenced by overtures from colleges. However, high school visits strongly influenced decisions by first-generation students and under-represented students of color. These students often felt that “school counselors had low expectations for them and were too quick to suggest that they attend community college” and were drawn to colleges that “made them feel wanted” by taking the time to visit. While [Holland \(2019\)](#) shows that college choice for under-served student populations often hinges on which colleges and universities take the time to visit, prior research has not systematically investigated which high schools receive visits by which colleges and universities.

Enrollment goals and recruiting

While the EM industry provides tools for identifying and targeting prospects at each stage of the enrollment funnel, university enrollment priorities dictate which prospects universities actually pursue. The “iron triangle” of enrollment management states that universities pursue the broad enrollment goals of academic profile, revenue, and access ([Cheslock & Kroc, 2012](#)). “Academic profile” refers to enrolling high-achieving students – particularly with respect to standardized test scores – who help the university move up the rankings. “Revenue” refers to students who generate high net tuition revenue. For public universities, the “access” goal refers to access for state residents, first-generation students, low-income students, and students of color from historically under-represented racial/ethnic groups. Because resources are scarce, the imagery of the iron triangle suggests that pursuing one goal involves trade-offs with other goals: “most enrollment management policies...do

not advance all three objectives; instead they lead to gains in some areas and declines in others" ([Cheslock & Kroc, 2012](#), p. 221). Enrollment managers view these trade-offs as an inevitable consequence of organizational enrollment priorities, thereby motivating the question, "what are the enrollment priorities of public universities?"

Drawing from theories of organizational behavior, we argue that university recruiting behavior is an indicator of enrollment priorities. New Institutional theory argues that organizations face pressure to publicly adopt goals demanded from constituencies in the external environment (e.g., move up in the rankings, increase socioeconomic and racial diversity) ([DiMaggio & Powell, 1983](#); [Meyer & Rowan, 1977](#)). However, organizations have scarce resources and cannot easily pursue goals that conflict with one another. Rather than publicly rejecting a goal demanded by the external environment, organizations resolve conflicts between stated goals by substantively adopting some goals and symbolically adopting others. Under substantive adoption, organizations allocate substantial resources towards achieving the goal. Under symbolic adoption, organizations adopt policies and rhetoric that signal commitment to the goal, but do not allocate substantial resources to achieving the goal. This perspective on organizational priorities is stated succinctly by the Joe Biden quote, "dont tell me what you value. Show me your budget and Ill tell you what you value."

Off-campus recruiting visits by university admissions staff represent a substantial allocation of resources (e.g., staff salary and benefits, travel costs). Therefore, we argue that comparing the characteristics of schools and communities that receive recruiting visits to those that do not can yield insights about university enrollment priorities. By contrast, speeches and

policy adoption (e.g., holistic admissions, "outreach" programs) (e.g., [The White House, 2014a](#)) show which goals are publicly adopted, but do not indicate which goals have been adopted substantively versus symbolically.

DATA AND METHODS

This report presents descriptive results from a broader project that collects data on off-campus recruiting by colleges and universities. Many universities advertise off-campus recruiting events on their admissions websites (e.g. "coming to your area" links). We used "web-scraping" to collect data on recruiting events. We "scraped" web-pages containing recruiting event data once per week from 1/1/2017 to 12/31/2017, thereby capturing recruitment of spring juniors and fall seniors. Here, we provide a broad overview of data collection, data processing, and analysis sample.

The data collection sample for the broader project was drawn from the population of public research-extensive universities (2000 Carnegie Classification). Out of all public research-extensive universities (N=102), the project collected data for those that posted off-campus recruiting events on their admissions websites (N=40). We also collected recruiting visit data from selective private research universities and from selective private liberal arts colleges.¹ For each university in the data collection sample, we investigated the entire university website, searching for URLs that contained data on off-campus recruiting events. This process was conducted independently by two

¹Out of all private universities in the top 100 of U.S. News and World Report National Universities rankings (N=58) and all private colleges in the top 50 of U.S. News and World Report Liberal Arts Colleges rankings (N=47), we collected data on 49 private research universities and 42 private liberal arts colleges.

members of the research team to avoid missing any relevant URLs. Our programs also scraped data about participation in national college fairs from the National Association for College Admission Counseling (NACAC) website. We also collected data about participation in “group travel tours” from websites advertising joint recruiting events by multiple universities (e.g., Peach State Tour by Georgia State University, Georgia Tech, and the University of Georgia). Since URLs containing data on off-campus recruiting events often change (e.g., a university creates a new URL or changes the formatting of an existing URL), we completed this investigation process for each university every three months and data collection scripts were updated accordingly.

Defining off-campus recruiting

We categorized off-campus recruiting events based on event *type*, *host*, and *location*. Event type includes college fairs (in which multiple colleges attend), day-time high school visits, group travel visits, formal admissions interviews, admitted student events, and committed student events. Event hosts include paid staff, paid consultants (e.g., a regional recruiter contracted by the university), alumni, and current students. Event locations include high schools, community colleges, hotels, conference/convention centers, and other public places (e.g., cafes).

For the purpose of our research, we define off-campus recruiting events as those that focused on soliciting undergraduate admissions applications and were hosted by paid personnel or consultants at any off-campus location. This definition includes off-campus events targeted at guidance counselors. We also included virtual events (e.g., webinar, video call) with a

target audience at a specific off-campus location (e.g., students from a particular high school). However, our definition excludes admitted and committed student events. Additionally, we excluded formal one-on-one interviews because these events focus on determining admissions eligibility of a particular prospect; they are not events that focus on soliciting applications from many prospective students. We excluded events hosted by alumni or student volunteers because theories of organizational behavior suggest that the activities of paid staff are better indicators of organizational priorities than activities allocated to volunteers ([Thompson, 1967](#)).

Analysis sample

The analysis sample for this report consists of 15 public research universities. These cases were selected from the larger project sample and selected based on “completeness” of recruiting event data posted on admissions websites. Based on prior market and scholarly research (e.g., [Holland, 2019](#); [Ruffalo Noel-Levitz, 2017, 2018](#); [Stevens, 2007](#)) and conversations with admissions professionals, nearly all colleges and universities convene three broad types of off-campus recruiting events: (1) receptions/college fairs at hotels and convention centers; (2) evening college fairs at local high schools; and (3) day-time visits at local high schools. However, some institutions we collected data from did not post all three types of recruiting events. Of the 40 public research universities we collected data on, these 15 universities posted all three broad types of off-campus recruiting events on their website.

Table 1 shows how the median university in our sample compares to the median university in the population of public “Doctoral/Research Universities-

Extensive,” as defined by the 2015 Carnegie Classification. Overall, our analysis sample appears fairly similar to the population. However, our sample institutions are slightly larger in size and have a higher tuition and state revenue.

Data processing and data quality

We took a multi-step approach to processing information scraped from admissions webpages. First, automated Python scripts scrape all text from admissions webpages, storing the information as HTML text in a Structured Query Language (SQL) database on a remote server. Separate scripts parse the HTML text into tabular data (e.g., columns for event date, event time, school name, address). Third, we “geocode” recruiting events, converting limited location information (e.g., school name, city, state) into geographic coordinates. Geocoding scripts take location information, query the Google Maps Application Program Interface (API), and return more detailed geographic information for each event (e.g., latitude and longitude coordinates, county, city, state, full street address, zip code).

We conducted two additional data quality checks. First, we manually checked each scraped recruiting event, ensuring that event “type” (e.g., public high school visit) was correctly categorized and that each event was merged to the correct secondary data source (e.g., the correct NCES school ID).

Second, we checked the completeness of web-scraped data by issuing public records requests for the list of all off-campus recruiting events and then comparing the two data sources. Though we requested this data from all universities, our request was denied by the University of Alabama and University of Arkansas because statutes in these states only permit public records requests from state residents. We received data from 7 universities, whereas 6 universities refused or have not sent us data at the time of this report. For universities that sent us data, we used “requested” data rather than “scraped” data for the analyses below. Requested data was also manually checked to ensure that event type was correctly categorized and that each event was merged to the correct secondary data source. Broad patterns were similar

	Sample (N=15)	Population (N=80)
US News & World Report Ranking	92	94
25th Percentile SAT/ACT Composite Score	1,126	1,085
75th Percentile SAT/ACT Composite Score	1,334	1,300
Total Enrolled Freshmen	5,433	4,957
Percent Out-of-State Freshmen	26.9%	25.4%
In-State Tuition + Fees	\$11,706	\$11,026
Out-of-State Tuition + Fees	\$30,414	\$29,441
Percent Pell Recipients	20.3%	24.0%
Total Net Tuition Revenue	\$463,142,400	\$379,065,984
Percent of Total Revenue from Tuition	25.5%	26.3%
Total State Appropriations	\$286,740,832	\$267,926,000
Appropriation per Student	\$9,548	\$7,903
Percent of Total Revenue from State Appropriations	19.5%	16.7%
Total State Revenue	\$295,350,848	\$290,634,448
Revenue per Student	\$11,347	\$8,970
Percent of Total Revenue from State (All Sources)	21.1%	19.4%

across requested data versus scraped data and results based on scraped data are available upon request. Detailed information about our data methodology is available at <https://emraresearch.org/methodology>.

Limitations

Our data collection has several limitations. First, off-campus visits encompasses only one university recruiting effort. Universities may also be recruiting students via other interventions (e.g., direct mailings, emails, specific outreach programs). Second, despite our best efforts to collect and triangulate off-campus recruiting data from more than one source to validate completeness, our data may not capture all off-campus recruiting events by each university. Third, prior research suggests that the capacity of a high school to host an event (e.g., having high school guidance counselors focused on college access) affects which universities visit it (Stevens, 2007). Unfortunately, the National Center for Education Statistics collects high school finance data and personnel data on guidance counselors at the district-level rather than the school-level. Therefore, our analyses do not account for differences in high school-level capacity to host recruiting visits. Fourth, for events hosted at community colleges, we cannot infer whether the event targets all prospective students in the local community or whether the event specifically target prospective transfer students enrolled at that community college.

STATE AND INSTITUTIONAL CONTEXT

Before presenting results on university recruiting behavior, we provide a brief overview of state and institutional contexts across universities. Revenue sources

for public universities have shifted in recent decades. Figure A1 in the Appendix shows change over time in state appropriations and tuition revenue for all 15 universities from 2003-04 through 2016-17. Many universities experienced declines in state appropriations and growth in tuition revenue. However, generosity of state appropriations differs substantially across universities. For example, Figure 3 shows that state appropriations per full time equivalent (FTE) student declined from \$25,000 in 2003-04 to \$21,000 in 2016-17 for SUNY-Stony Brook. Figure 4 shows the University of Pittsburgh experienced smaller declines in state appropriations than Stony Brook during this same time; however, the University of Pittsburgh only received \$6,000 per student FTE in 2016-17.

Figure 5 plots all universities according to their 2016-17 revenue from state appropriations (X Axis) and tuition revenue (Y Axis) per full-time equivalent student. Four universities receive more revenue from state appropriations than tuition (Stony Brook, NC State, Nebraska, Arkansas). Three universities receive about equal revenue from state appropriations and tuition (Kansas, Georgia, UMass Amherst). The remaining seven universities receive more revenue from tuition than state appropriations per FTE student. Of these, CU-Boulder, the University of Pittsburgh, University of South Carolina, and University of Cincinnati are particularly reliant on tuition revenue.

Appendix Figure A2 shows the percent of freshmen who are nonresident and the percent of freshman who are federal grant recipients for all 15 universities from 2003-04 to 2016-17. Many universities experienced significant nonresident enrollment growth, consistent with research showing that public universities respond to state disinvestment by pursuing nonresident students who pay higher tuition (Jaquette & Curs, 2015).

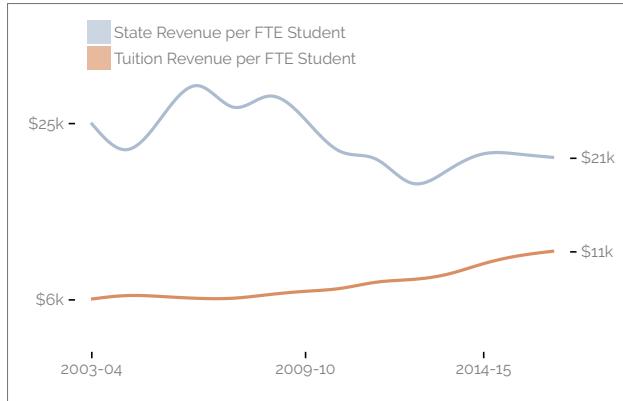

FIGURE 3: STONY BROOK STATE AND TUITION REVENUES PER FTE STUDENT.

For example, Figure 6 shows that percent of nonresident freshman at the University of Alabama increased from 26% in 2003-04 to 68% in 2016-17. Some universities experienced similar increases in nonresident enrollment (Stony Brook, Pittsburgh, Nebraska, South

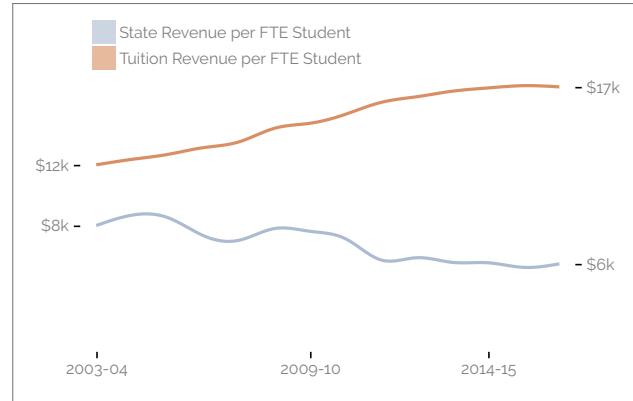

FIGURE 4: UNIVERSITY OF PITTSBURGH STATE AND TUITION REVENUES PER FTE STUDENT.

Carolina, UC Berkeley, UC Irvine, Kansas, Arkansas), whereas other universities had more moderate increases in enrollment from nonresident freshman students (Rutgers, Cincinnati, Georgia, NC State, CU Boulder, UMass Amherst).

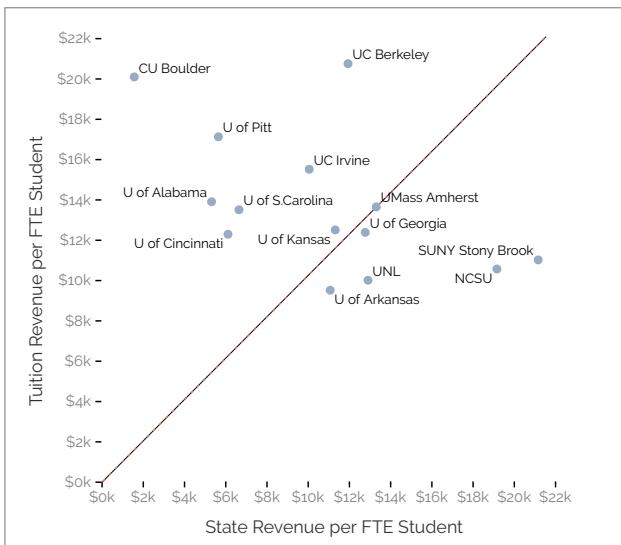

FIGURE 5: STATE AND TUITION REVENUE PER FTE STUDENT FOR SAMPLE INSTITUTIONS IN 2016-17.

Nationally, enrollment of Pell recipients increased substantially in 2008-09 following the expansion of Pell Grant funding by the Obama administration. Since 2010-11, however, the percent of federal grant recipients declined at several universities in our sample, as shown in Appendix Figure A2. Jaquette et al. (2016) show that growth in the share of nonresident students is associated with declines in the share of grant aid recipients. This relationship can be seen in Figure 6 for the University of Alabama, where the percent of full-time freshmen receiving federal grants decreased from 18% in 2003-04 to 17% in 2016-17.

The racial composition of state populations and freshman enrollments have also shifted over time for many universities. Appendix Figure A3 shows change over time in the percent of freshman at each university who

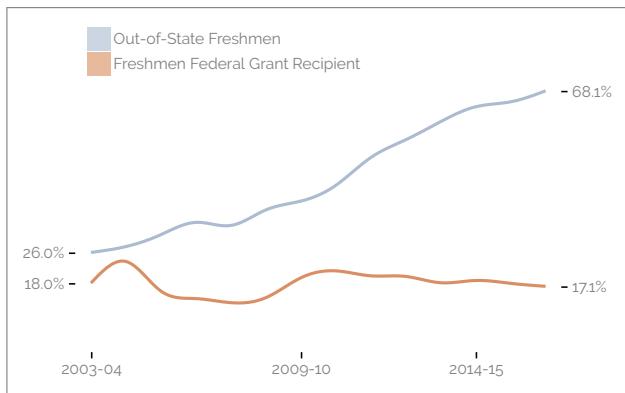

FIGURE 6: UNIVERSITY OF ALABAMA PERCENT OUT-OF-STATE FRESHMEN AND GRANT RECIPIENT

identify as Black and the percent of 18 year-olds in the state who identify as Black. Appendix Figure A4 shows the same trends for people who identify as Latinx. Most universities experienced modest (or no change) in the proportion of Black college-aged students in their state, but nearly all experienced relatively larger increases in the proportion of Latinx college-aged students. While changes in the proportion of Black and Latinx freshman enrollments have trended similar to state populations for most universities, no university matched the proportion of Black and Latinx freshman enrollments to the proportion of Black and Latinx college-age populations in their state.

RESULTS

Table 2 presents the total number of off-campus recruiting visits by visit “type” and by in-state or out-of-state location for each university. Nearly all universities made more out-of-state recruiting visits than in-state recruiting visits. The majority of out-of-state visits are made to public high schools and private

schools. While in-state visits also include a large proportion of visits to public high schools, many universities also make a substantial number of in-state visits to community colleges.

We organize results around these initial findings. First, out-of-state analyses focus on the characteristics of public and private high schools because these events comprise the vast majority of out-of-state recruiting visits. Because public universities hold unique responsibilities to serving state residents and providing pathways for community college transfer students, we then assess each university’s “coverage” of visiting in-state public high schools and in-state community colleges. Given our interest in using recruiting data to understand university enrollment priorities with respect to the iron triangle of enrollment management, our analyses focus on the income, race, and achievement characteristics of schools and communities that receive visits.

out-of-state Recruiting

Public high school visits. Table 2 shows that most cases in the study made more out-of-state recruiting visits than visits within their respective states. Alabama showcased the upper extreme of this trend with 3,957 out-of-state visits, which made up more than 90% of total recruiting visits by the university. While other universities made a relatively modest number of out-of-state visits in comparison to Alabama, these visits still made up large proportions of total visits by each university: Rutgers (59%), Stony Brook (60%), Arkansas (78%), Cincinnati (59%), CU Boulder (74%), Georgia (67%), Kansas (75%), UMass (69%), Nebraska (62%), Pittsburgh (73%). However, three universities that made less out-of-state visits

TABLE 2: NUMBER OF OFF-CAMPUS RECRUITING EVENTS BY TYPE AND IN-STATE, OUT-OF-STATE.

than in-state visits. UC Berkeley's 420 out-of-state visits made up less than half of all recruiting visits (46%). NC State's 124 out-of-state visits made up only 33% of total recruiting visits. Lastly, UC Irvines's 172 visits out-of-state visits made up only 18% of total recruiting visits.

Nearly all universities' out-of-state recruiting visits were located in populous metropolitan areas across the country. Almost all universities visited New York City, Los Angeles, Chicago, Dallas, Houston, Washington D.C., San Francisco, and Boston metropolitan areas. Other metropolitan areas less frequently visited across universities include Denver, Philadelphia, Baltimore, Miami, Jacksonville, Tampa, Orlando, and Atlanta.

Table 3 shows the characteristics of out-of-state public high schools that received and did not receive a visit by each university. For each university, the total number of out-of-state high schools in Table 3 includes all high schools in states that received at least one high school visit from that university. Our rationale for this

decision is that it is unhelpful to compare visited out-of-state schools to non-visited schools from states that the university ignored entirely. Thus, total number of out-of-state high schools differs across universities depending on the number of states the university visited. For example, South Carolina visited public high schools in 25 different states. All 12,086 public high schools in those states are included in the out-of-state public high school sample for South Carolina and an indicator is used for schools that received at least one recruiting visit by South Carolina (576 visited and 11,510 non-visited).

Income. Public high schools that received a visit were in zip codes with much higher median household incomes, on average, than schools that did not receive a visit. For example, CU Boulder visited out-of-state public high schools in zip codes where the average median household income was \$114,800, whereas schools that did not receive a visit were located in areas with an average median household income of \$62,600. This income disparity between visited and not visited schools

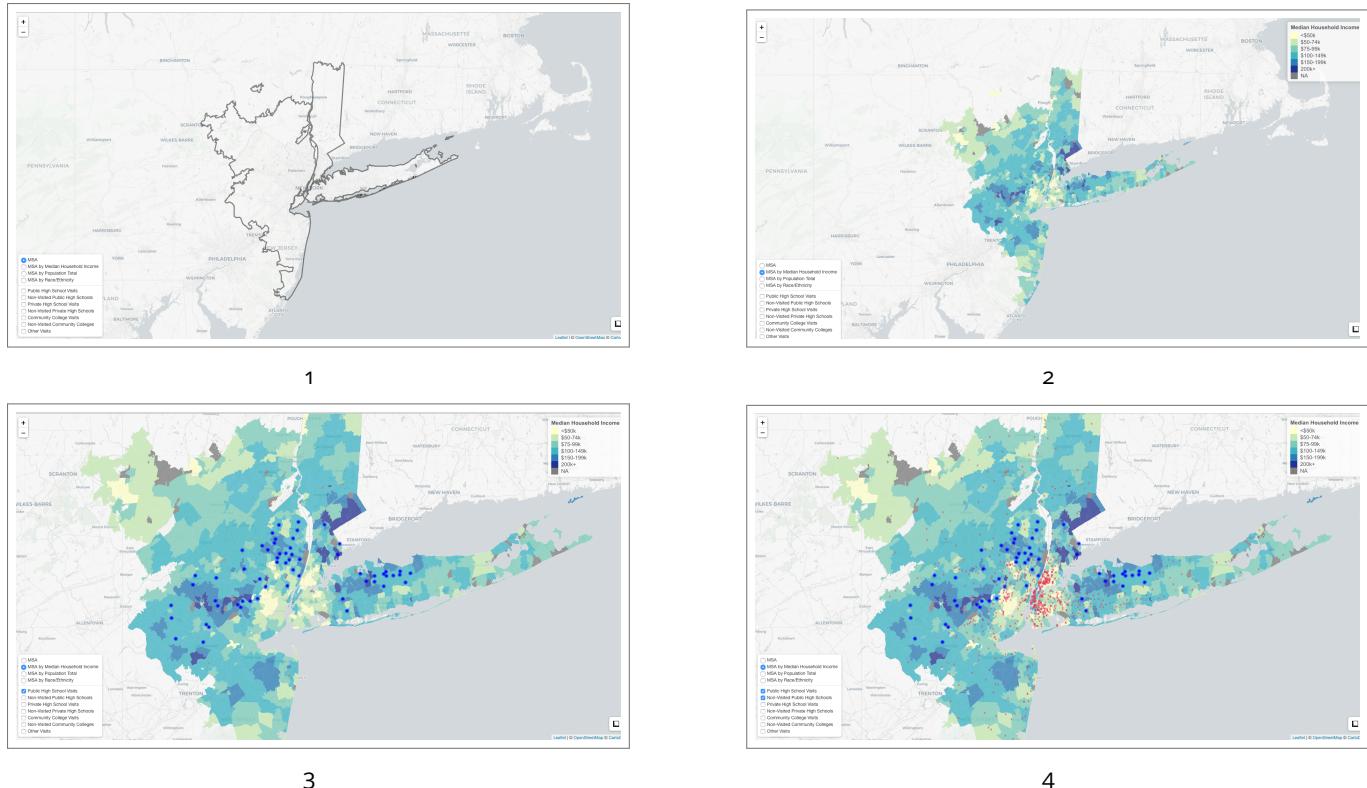

FIGURE 7: UNIVERSITY OF SOUTH CAROLINA-COLUMBIA IN NEW YORK CITY.

ranged from a low of \$27,400 for UC Irvine to a high of \$43,600 for Stony Brook.

Figure 7 “zooms” in to the New York City metropolitan area (NYC MSA) to show this income disparity geographically using a series of maps. The second figure uses a color layer to show the distribution of income in the metro area. The color legend indicates the average median household income at the zip-code level. The third figure uses blue circle markers to represent visits by South Carolina to public high schools in NYC MSA. The fourth figure adds red “x” markers to indi-

cate public high schools that did not receive a visit by South Carolina. Together, these figures show that the lowest income communities are located directly at the center of the metro area and are surrounded by some of the highest income communities in the metro. South Carolina’s visits to public high schools in the NYC MSA are located in the higher income communities, whereas the largest clusters of non visited schools are located at the center of the metro in the lowest income communities.

We examine whether this relationship between in-

come and the probability of receiving a visit persists after controlling for other factors that likely affect whether a public high school receives a visit. We control for: the percent enrollment from Black, Latinx, and Native American students; the number of 12th grade students; whether a school is located in a suburb, city, town or rural area; whether a school is a charter, magnet school, or traditional school; and distance from the university. We also account for student achievement using the number of students scoring at proficient levels in state math assessments. These assessments differ across states on several dimensions (e.g., what is tested, what counts as proficient, who is required to take the test). In turn, these differences across states may be correlated with other variables of interest in ways that affect regression coefficients. Nevertheless, we include this measure because achievement is one leg of the iron triangle of enrollment management and also to avoid the potential criticism that universities do not visit poor/minority schools because these schools have few "college ready" students.

Table 4 shows the results of regression models of the relationship between school characteristics on the probability of receiving a recruiting visit for each university. Results for variables that are not central to this report (e.g., urbanization, distance from the university) are not shown but are available upon request. Looking at the column of results for Alabama, the constant represents a high school falling within the reference category across all variables: a high school located in a zip code with less than \$50,000 average median income; with 0-20% enrollment from Black, Latinx, and Native American students; with less than 50 students in grade 12; with less than 50 students proficient in the math state assessment; located in a suburb within 10 miles of the university; and less than 50 students scor-

ing proficient in math. We can interpret the coefficient on the constant as the overall probability receiving a visit for schools with these characteristics by multiplying the coefficient on the constant (0.073) by 100. This would suggest that a high school consistent with the characteristics above has an overall 7% likelihood of receiving a visit by Alabama.

We interpret coefficients on the categorical measures of income by multiplying the coefficient on the specific category by 100 to indicate the percentage point change in the probability of receiving a visit for the specified category in comparison to the reference category. We use Alabama's regression results as an example. Whereas a school that has the value of the reference category for all variables—including being located in a zip code with an average median household income less than \$50,000—has an overall 7% chance of receiving a visit by Alabama, a school located in a community with a \$75,000-\$99,000 average median household income has an overall 15% chance of receiving a visit (or 8% more likely if we interpret the coefficient directly). This probability increases to 21% ($p<0.001$) more likely for schools in areas with \$100,000-\$149,000 average median incomes, to 42% more likely for schools in areas with \$150,000-\$199,000 incomes, to finally 48% ($p<0.001$) more likely to receive a visit for schools located in communities with more than \$200,000 average incomes. In other words, a school located in a community with an average median income of \$200,000 has an overall 55% likelihood of receiving a visit by Alabama in comparison to the overall 7% likelihood for a school with an average median income less than \$50,000, holding all other variables constant.

Overall, the regression results from Table 4 show that public high schools located in communities with higher average median incomes are more likely to re-

ceive a visit than schools in low income communities across recruiting by all universities. Generally, the magnitude of this relationship is larger for higher income bands than lower income bands. For example, schools in all income ranges greater than \$75,000 average median incomes are significantly more likely to receive a visit by Pittsburgh than schools with less than \$50,000 average median incomes. However, this probability increases from only 3% more likely to receive a visit for schools with \$75,000-\$99,000 average median household incomes to nearly 55% more likely to receive a visit for schools located in communities with more than \$200,000 average incomes.

Race. Out-of-state recruiting across most universities also show evidence of racial bias. Table 3 shows the the racial composition of visits to out-of-state public high schools. All universities in the study visited schools that on average enrolled smaller proportions of Black, Latinx, and Native American students than

schools not visited. For example, UMass Amherst visited out-of-state public high schools where Black, Latinx, and Native American students, on average, made up 24% of total student enrollments. Whereas Black, Latinx, and Native American students made up, on average, 44% of total enrollments at schools that did not receive a visit by UMass Amherst. However, this difference was modest for Nebraska. Nebraska visited schools where Black, Latinx, and Native American students made up 27% of total enrollments in comparison to 29% of total enrollments at non visited schools.

We “zoom” in to the Chicago metropolitan area to map the racial disparity between public high schools that received a visit and did not receive a visit by the University of Pittsburgh in Figure 8. The color legend indicates the proportion of the total zipcode population that is made up by Black, Latinx, and Native American subpopulations. The figure shows that communities of color are located in the eastern part of the metro

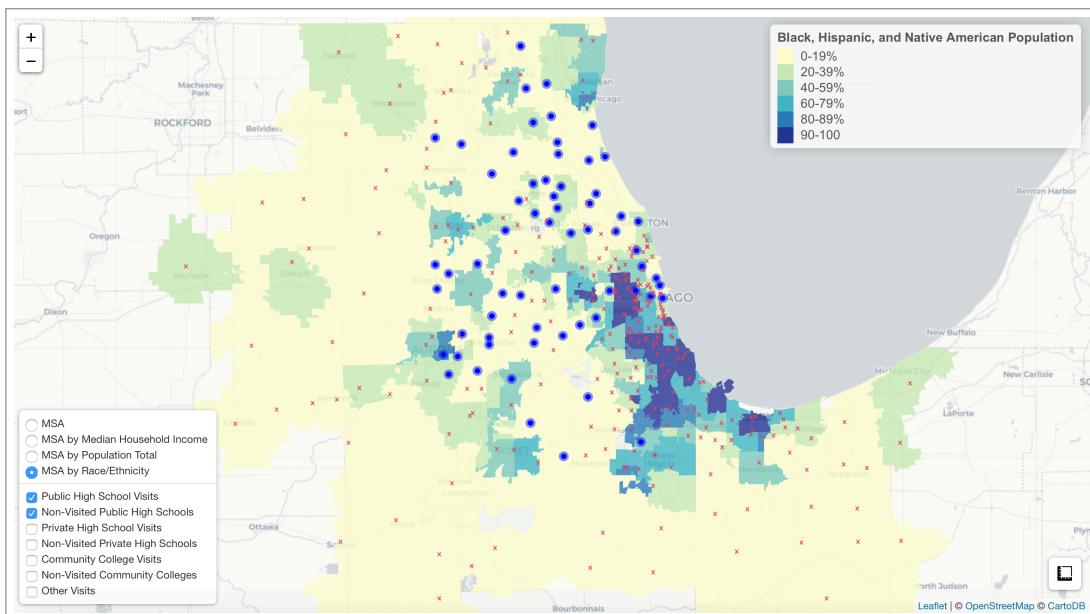

FIGURE 8: UNIVERSITY OF PITTSBURGH IN CHICAGO.

area whereas predominantly White communities are located in the western part of the metro area. Blue circle markers represent visits to public high schools and red "x" markers indicate public high schools that did not receive a visit. These maps show that the majority of Pittsburghs' visits to public high schools in the Chicago metropolitan area are located in whitest communities of the metro, with only a few visits to predominantly communities of color in the west side of Chicago. Additionally, the largest clusters of non visited high schools are located in predominantly communities of color near the south and far south areas of Chicago.

We use the regression results in Table 4 to explore whether the relationship between the racial composition of public high schools and receiving a visit persists after controlling for factors that are likely to affect a school's probability of receiving a visit (summarized above). Using visits by UMass Amherst as an example, a high school that has the value of the reference category for all variables – including less than 20% enrollment from Black, Latinx, and Native American students – has an overall 8% chance of receiving a visit by UMass Amherst. By contrast, a school with more than 90% enrollment from Black, Latinx, and Native American students has overall 2% chance of receiving a visit (or 6% less likely if we interpret the coefficient directly).

Overall, the regression results from Table 4 show that public high schools with larger proportions of Black, Latinx, and Native American students are less likely to receive visits than schools with smaller proportions of these students across recruiting by most universities. For example, the column for UMass Amherst in Table 4 shows that out-of-state public high schools with 40-59% enrollment from Black, Latinx, Native American students are 3% ($p<0.001$) less likely to receive a visit

from UMass Amherst than schools with less than 20% enrollment from these students. This probability increases to 4% ($p<0.001$) less likely for schools with 60-79% enrollment, to 5% ($p<0.001$) less likely for 80-89% enrollment, to 6% ($p<0.001$) less likely for schools with more than 90% enrollment from Black, Latinx, and Native American students.

For 12 of the 15 universities, public high schools where Black, Latinx, and Native American students make up more than 90% of all student enrollments were less likely to receive a recruiting visit than school with less than 20% enrollment from these student groups. This probability ranges from from 2% ($p<0.001$) less like to receive a visit (Arkansas, UC Berkeley, Kansas) to 8% ($p<0.001$) less likely to receive a visit (Stony Brook). However, results for the other three cases (NC State, Cincinnati, Nebraska) show that predominantly Black, Latinx, and Native American enrollment does not significantly explain the probability of a high school receiving a visit after accounting for other factors.

Other characteristics. We also explore relationships between visits and other school characteristics. Not surprisingly, Table 3 shows that public high schools that receive visits have, on average, larger grade 12 enrollments than not visited schools. Regression results in Table 4 echo this finding. The largest public high schools (with more than 500 12th grade students) are significantly more likely to receive a visit than the smallest public high schools (less than 50 grade 12 students) across recruiting by all universities. We also find visited schools are more likely to be located in a suburb in comparison to non visited schools (results available upon request). Regression results do not find a consistent pattern in the relationship between visits and school type. In some cases magnet high schools are more likely to receive a visit than reg-

ular high schools (Stony Brook, UC Irvine, UC Berkeley), whereas for other universities charters are more likely to receive a visit than regular schools (Alabama, Arkansas, Cincinnati, Kansas, South Carolina). Lastly, while visited high schools are generally in closer proximity to the university, the difference in distance from the university between visited and not visited schools varied from less than 20 miles (UC Berkeley) to over 400 miles (UMass).

Private high school visits. We find that out-of-state recruiting efforts across nearly all universities focused on visiting a disproportionate number of private schools.

We use school totals from Tables 3 and 5 to calculate the actual number of private school and public high schools visited compared to the hypothetical number of public and private high schools that would have been visited if each school had an equal probability of receiving a visit. For example, there are 10,002 public high schools and 2,379 private schools in visited states by Georgia. Proportionately, public schools make up 81% (10,002 of 12,381) and private schools make up 19% (2,379 of 12,381) of total schools in these states. We use this proportion to hypothetically estimate how many of Georgia's 442 total out-of-state high school visits would be to private and public schools if each school had an equal probability of receiving a visit. Georgia would have made 85 private school visits (19% of 442 total visits) and 357 public high school visits (81% of 442 total visits) if each school had an equal probability of receiving a visit. Yet Georgia's 193 private high school visits are more than double the number that would have been visited if each school had an equal probability of receiving a visit.

Figure 9 shows graphs of the actual number of visits to

public and private schools compared to our calculated number of visits under equal probability of receiving a visit for each university. These graphs show that the actual number of private school visits exceeded the estimated number of visits under equal probability for 12 of the 15 universities. These findings coincide with patterns of income bias within out-of-state recruiting efforts. Prior research suggests that private schools receive a disproportionate number of recruiting visits because private school students tend to be more wealthy ([Stevens, 2007](#)).

Descriptive results in Table 5 shows that private schools also tend to be predominantly white schools. Additionally, Table 5 shows that for Georgia the mean 12th grade enrollment for visited out-of-state private schools is 134 compared to mean 12th grade enrollment for public high schools is 490. This difference in mean 12th grade enrollment is consistent across all universities. While this difference is partially a function of private schools tending to be smaller than publics, the findings suggest that universities are more willing to make recruiting visits to private out-of-state schools with smaller enrollment than out-of-state public high schools.

Geographics Focus While all universities focused out-of-state recruiting efforts in metropolitan areas, the geographic focus of these visits differed across universities. Figure 10 shows small multiple maps of recruiting patterns for each university. Four universities had a regional focus to out-of-state recruiting: Stony Brook, Arkansas, Nebraska, and NC State. That is the vast majority of their out-of-state visits are to metropolitan areas in neighboring states and in states within their local regions. For example, Nebraska's out-of-state visits are concentrated in other Midwest states or in the neighboring state of Colorado.

FIGURE 10: MAP OF VISITS.

Most universities followed what we conceptualize as a regional focus combined with a targeted national approach to out-of-state recruiting. What we mean by this is that universities visited metropolitan areas in their local region and some metropolitan areas in other regions of the country. For example, Georgia's out-of-state visits are heavily concentrated in the South but also made many visits to the Chicago, Los Angeles, San Francisco, and New York City metropolitan areas.

Lastly, four universities- Alabama, CU Boulder, UC Berkeley, and UC Irvine- followed what we call a national approach to out-of-state recruiting. By this we mean that universities made out-of-state recruiting visits across the country without any particular regional focus. For example, CU Boulder's out-of-state visits were spread across the country and weren't clustered in any region of the country. While the geographic focus of out-of-state recruiting was similar across these four universities, UC Berkeley and UC Irvine had more in-state visits than out-of-state visits. By contrast, Alabama and Boulder have many more out-of-state visits than in-state visits.

In-State Recruiting

Public high school visits, coverage. Because public universities hold unique responsibilities in providing educational opportunities to state residents and transfer pathways for community college students, we assess universities on their "coverage" of public high schools and community colleges in their respective states. We define coverage as the proportion of visited public high schools or community colleges to the total number of schools or colleges within the state.

Table 6 presents descriptive statistics for in-state public high schools that received and did not receive visits by each university. For example, of the 504 public high schools in North Carolina, 28% received at least one recruiting visit by NC State. Four other cases also had limited coverage of public high schools in their states: Alabama (33%), Cincinnati (43%), Georgia (41%), and Pittsburgh (28%). Some cases had a relatively greater coverage of high schools, including Arkansas (52%), Kansas (48%), UMass Amherst (61%), South Carolina (57%), CU Boulder (57%), and Rutgers(60%). Only one university amongst the 15 had extensive coverage of their states public high schools. Nebraska visited nearly 9 of every 10 public high schools in the state.

Three universities in very populous states are assessed on their coverage using different jurisdictions besides their entire state. For example, Stony Brook is part of the State University System of New York (SUNY) in a populous state and may be reasonably expected to cover public high schools in its surrounding counties. Whereas Stony Brook may have limited coverage of all 1,190 public high schools in the state of New York, it has extensive coverage of its SUNY system jurisdiction of Long Island (XX%). Given California is the most populous state in the country, we also restrict UC Berkeley's and UC Irvine's coverage to their respective metropolitan areas. Restricting coverage to local public high schools in their surrounding metropolitan areas, we find that UC Berkeley and UC Irvine have XX% and XX% coverage, respectively.

Public high school visits, achievement. It may be reasonable to conclude that schools with a larger number high achieving students are more likely to receive a visit. we use the number of students scoring proficient on state math assessments as a proxy for a school's academic achievement. While this measure

is used only as a control for our out-of-state analyses due to its cross-state comparison limitations, we substantively explore relationships between a school's academic achievement and the probability of receiving a recruiting visit by their in-state university.

Table 6 reports the mean number of students scoring proficient on state math assessments for in-state public high schools that received a visit and for those that did not receive a visit by each university. Across all universities, schools that received a recruiting visit had a higher average number of students scoring at proficient levels than schools that did not receive a visit. However, Table 6 also shows that schools that receive visits also tend to have a greater number of grade 12 students than schools that did not receive a visit.

We use regression results for in-state high schools in Table 7 to explore whether the probability of visiting a school is driven by achievement and/or size. Results suggest that in-state recruiting visits are primarily driven by grade 12 enrollment for most universities. This includes NC State, Alabama, Arkansas, UC Berkeley, Cincinnati, CU Boulder, Kansas, and Nebraska. For these universities, coefficients on number of students scoring at proficient levels are not significant when holding grade 12 constant. However, grade 12 is significant while holding number of students scoring at proficient levels constant. We find the opposite relationship between schools achievement and size for Rutgers, Stony Brook, and UMass Amherst. School achievement and size both significantly predicted the probability of receiving a visit for only two universities: UC Irvine and Georgia.

Public high school visits, income. For most universities, we find that recruiting visits to in-state public high schools demonstrated patterns of income bias. Table 6

presents descriptive statistics for in-state public high schools that received and did not receive visits by each university. With the exception of recruiting by NC State and UC Irvine, the average median income of visited schools across all cases was larger than schools that did not receive visits. The magnitude of the income difference between visited and not visited in-state schools was relatively smaller than that of out-of-state schools. For example, within the set of schools that reasonably have state-wide jurisdictions, the difference in average median income between visited and not visited schools ranged from \$1,000 for Nebraska (\$63,400 for visited schools and \$62,400 for not visited schools) to \$19,600 for Pittsburgh (\$78,700 for visited schools and \$59,100 for not visited schools).

We again use a series of maps to show the relationship between income and the probability of receiving a visit geographically. Figures 11 show in-state recruiting for NC State, Alabama, UC Irvine, and UC Berkeley. For UC Irvine and UC Berkeley we show recruiting within the Los Angeles and San Francisco metropolitan areas rather than all of California, respectively. Similar to out-of-state maps, these figures use color layers to indicate the average median household income at the zip-code level, blue dots represent visited high schools, and red "x's" represent non visited public high schools. These maps confirm the descriptive results above. NC State's visits are geographically distributed across all income ranges in the state and schools that did not receive a visit are located in both high and low income communities. In-state schools visited by Alabama are clustered in the highest income communities of the state whereas non visited schools are geographically distributed across the state, much of which is made up of low income communities. UC Irvine's visits are generally located in low-income communities throughout

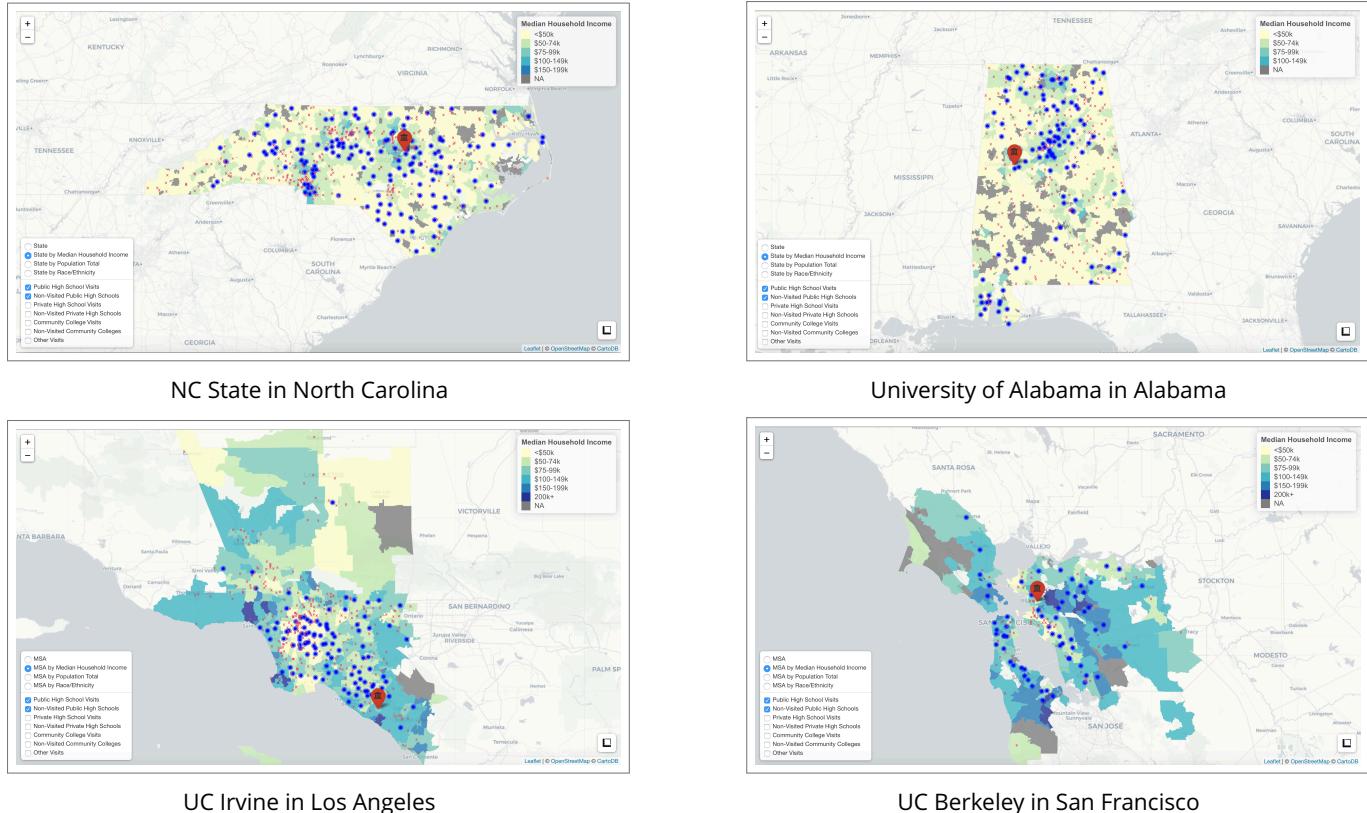

FIGURE 11: INCOME BIAS IN IN-STATE PUBLIC HIGH SCHOOL VISITS.

the Los Angeles metropolitan area. More so, schools in the highest income communities in the metro did not receive visits. Lastly, UC Berkeley's visits in the San Francisco metropolitan area are generally distributed across low-income and high-income communities. However, the largest cluster of non visited schools are located in low-income communities near Oakland whereas a relatively smaller number of schools in high income coastal areas of the metro did not receive a visit.

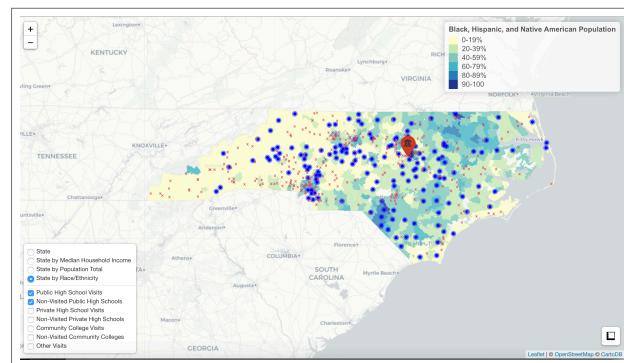

Regression results in Table 7 suggest that income bias by most universities persists after controlling for other factors. However, the magnitude of this relationship varies across income bands for different universities. For some universities only the most affluent schools are significantly more likely to receive a visit. For example, only schools located in communities with \$150,000-\$199,000 average median household incomes are significantly more likely (by 40%) to receive a visit by Georgia than schools located in areas with less than \$50,000 incomes. For several universities (Rutgers,

Alabama, and Arkansas), the income bias in descriptive results faded after controlling for other factors. Also consistent with descriptive relationships above, schools in more affluent communities are significantly less likely to receive recruiting visits by NC State and UC Irvine.

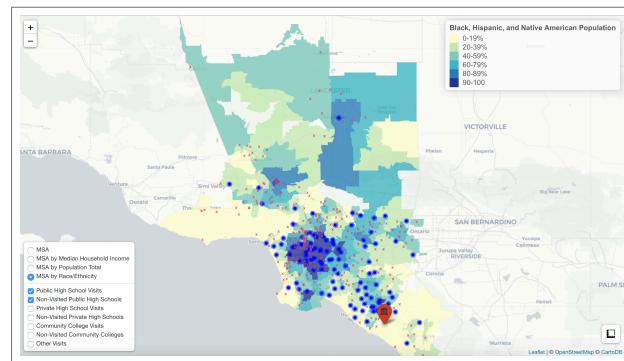

Public high school visits, race. Patterns of racial bias within in-state recruiting differs across universities. Table 6 shows the the racial composition of visits to in-state public high schools. Some universities on average visited in-state public high schools with smaller proportions of Black, Latinx, and Native American students than non visited schools (NC State, Rutgers,

Stony Brook, Alabama, Arkansas, UC Berkeley, Georgia, UMass Amherst, Nebraska, Pittsburgh South Carolina). However, other universities on average visited in-state public high schools with larger proportions of Black, Latinx, and Native American students than non visited schools (UC Irvine, Cincinnati, CU Boulder, Kansas). However, in comparison to out-of-state visits to public high schools, the difference in average racial composition of visited schools versus non visited schools was relatively small across all cases.

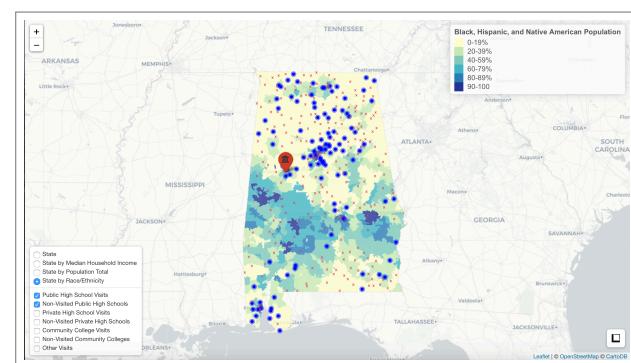

Figure 12 show in-state recruiting for NC State, Alabama, UC Irvine, and UC Berkeley using color layers to indicate the proportion of the total zipcode pop-

UC Berkeley in San Francisco

FIGURE 12: RACIAL BIAS IN IN-STATE PUBLIC HIGH SCHOOL VISITS.

ulation that is made up by Black, Latinx, and Native American subpopulations. These figures illustrate the differences in racial bias across universities. For NC State, visits and non visits are geographically distributed across predominantly white communities and predominantly communities of color in the state. The map for Alabama shows that visits are clustered in the predominantly white communities in the northern and southern regions of the state, while only a few predominantly schools of color located in the state's "Black Belt" region received a visit. The majority of UC Irvine's visits to public high schools in the Los Angeles metropolitan area are located within predominantly communities of color, with only a few visits to whitest communities in the metro. Lastly, UC Berkeley's visits in the San Francisco metropolitan area are geographically distributed across white communities and communities of color. However, given the largest clusters of non visited high schools are located in some of the metro's only predominantly communities of color located in Oakland.

Regression results in Table 7 suggest racial bias persists after controlling for other factors for three universities: Alabama, Kansas, and Pittsburgh. In-state public high schools where Black, Latinx, and Native American students make up more than 90% of all student enrollments were 24% ($p < .001$) less likely to receive a visit by Alabama than schools with less than 20% enrollment from these student groups. Schools with 60-79% enrollment from students of color were 24% less likely ($p < .05$) and 18% ($p < .05$) less likely to receive a visit by Kansas and Pittsburgh, respectively. For remaining cases, regression results suggest that racial bias does not persist after controlling for other school characteristics. More so, we find that in-state public high schools with large proportional enrollments from

Black, Latinx, and Native American students are significantly more likely to receive recruiting visits by some universities (Rutgers, UC Berkeley, UC Irvine, Georgia, South Carolina).

While out-of-state recruiting visits ignore rural communities entirely, we find that many universities make visits to rural communities within their respective states. Table 6 provides the proportion of visited and non visited in-state public high schools by locale for each university. For in-state recruiting by a few universities, visits included a greater proportion of high schools located in rural areas than non visited schools. For example, nearly 54% of schools that received a visit by NC State were located in rural areas of North Carolina, whereas only 41% of non visited schools were located in rural areas. This finding was also true of recruiting by Stony Brook and UMass Amherst. For all other universities, a smaller proportion of visited schools were located rural areas than non visited schools.

Community college visits. Lastly, we assess universities on their "coverage" of community colleges in their state jurisdictions². Table 8 presents descriptive statistics for in-state community colleges that received and did not receive visits by each university. Results suggest that coverage varies substantially across universities. For example, Alabama was one of 7 universities that visited more than two thirds of community colleges in their state. The university visited nearly 80% of community colleges in the state (23 of 26). Other universities with extensive coverage included NC State (72%), Rutgers (71%), CU Boulder (71%), and Nebraska (75%). UC Berkeley and UC Irvine had extensive coverage of community colleges across California despite

²We define community college as any public, 2-year or public, less-than 2-year institution, which could be a campus of a Title IV institution

reasonably having smaller alternate jurisdictions, 73% and 77% respectively. Arkansas (58%), UMass Amherst (54%), Kansas (54%) had relatively more modest coverage, including Stony Brook's XX% coverage of community colleges in Long Island. However, other universities had limited coverage of community colleges: Georgia (4%), Cincinnati (20%), Pittsburgh (20%), and South Carolina (10%).

DISCUSSION AND IMPLICATIONS

Summary

This study investigated off-campus recruiting visits by public research universities, which we argue are indicators of university enrollment priorities. The majority of universities in our sample made more than twice as many out-of-state recruiting visits than in-state recruiting visits. Out-of-state visits were almost exclusively in metropolitan areas, ignoring rural communities. Further, these out-of-state visits focused on in affluent, predominantly White public schools and predominantly White private schools.

With respect to in-state visits, the majority of universities were more likely to visit public high schools in affluent communities than poorer communities, even after controlling for other factors such as enrollment size and student achievement. The findings for race were inconsistent across universities, in both simple descriptive statistics and in regression models that controlled for other factors. Some universities were more likely to visit schools with higher percentages of Black/Latinx/Native students (e.g., UC-Irvine). Some universities were less likely to visit majority-minority schools (e.g., University of Alabama). Other univer-

sities showed no relationship between racial composition and the probability of receiving a visit after controlling for other factors (e.g., CU-Boulder, UMass-Amherst)

With respect to in-state "coverage," most universities did not visit the majority of public high schools in their home state. This finding is not an indictment in that universities in large, populous states cannot be expected to visit every high school. Generally, universities with stronger state funding tended to cover their home state more thoroughly and equitably. For example, The University of Nebraska-Lincoln visited most public high schools in Nebraska. SUNY-Stony Brook visited most public high schools in its "home" jurisdiction of Long Island. Both NC State and UC-Irvine made more in-state recruiting visits than out-of-state visits and these in-state visits did not exhibit socioeconomic or racial bias. Universities with weaker state funding tended to focus recruiting efforts out-of-state and did a poorer job covering their home state (e.g., University of Alabama, University of South Carolina). However, there are exceptions to these general findings.

Viewing university recruiting patterns holistically, most universities exhibited income and racial biases. The income story is clearer and larger in magnitude; out-of-state visits showed dramatic bias towards affluent communities and in-state visits tended to show moderate, though significant bias towards affluent communities. The race story is more nuanced. In-state visits did not show consistent racial bias. However, out-of-state visits consistently showed racial bias. Since out-of-state visits dwarfed in-state visits for most universities, overall recruiting patterns were biased against communities of color for most universities.

Rethinking Access Inequality

Mainstream policy discourse about access inequality draws heavily from scholarship by economists and places responsibility on students and K-12 schools rather than universities. For example, the 2014 White House “Access Summitt” commissioned a literature review of the causes of access inequality ([The White House, 2014b](#)). This review highlighted the “achievement gap” and “under-matching” – the idea that high-achieving, low-income students do not apply to selective colleges because they do not obtain information and guidance about college choices at home or at school ([Hoxby & Avery, 2013](#); [J. Smith, Pender, & Howell, 2013](#)). Economic theory rationalizes access inequality due to the achievement gap based on the idea that the most talented students make the most of learning opportunities afforded by universities with superior resources ([Hoxby, 2009](#); [Rothschild & White, 1995](#); [Winston, 1999, 2003](#)). By contrast, under-matching is antithetical to economic theory because the best “inputs” are not going to the best college. In turn, the under-matching literature has motivated dozens of interventions designed to change student behavior by providing information and guidance (e.g., [Castleman & Goodman, 2018](#); [Cunha, Miller, & Weisburst, 2018](#); [Page & Scott-Clayton, 2016](#)).

Our findings about off-campus recruiting suggest an alternative explanation for under-matching. [Holland \(2019\)](#) shows that under-represented student populations are particularly sensitive to which universities take time to visit their high school. For many states, our findings paint a picture of poor or majority-minority high schools being unlikely to receive a recruiting visit from the state flagship university. Similarly, Means [Means \(2016, August 31\)](#) analysis of rural

students at a predominantly African American high school in Georgia found that the military and local technical college were the only institutions that visited their high school. By contrast, affluent high schools are more likely to receive visits from their state flagship university and from selective public and private universities from across the country. When students attend a high school that does not receive a visit from a university, they are less likely to know the university is an option. Therefore, the recruiting patterns we observed create information asymmetries that are strongly related to race and class. These recruiting patterns also create differences in the extent to which students “feel wanted” – by specific universities and by higher education in general – that are correlated with race and class ([Holland, 2019](#)). Given these findings, we suggest that “under-matching” may often be caused by “under-recruiting” rather than lack of guidance.

While recruiting behavior affects student opportunities, our research analyzes recruiting behavior as a means of gaining insight about university enrollment priorities. Mainstream policy discourse assumes that universities are passive recipients of applications or are progressive actors doing their best to increase access in spite of the deficiencies of students and K-12 schools [The White House \(2014a, 2014b\)](#). The implicit assumption here is that doubling the number of applications from high-achieving low-income students will double their enrollment. By contrast, our analyses suggests that the majority of public research universities prefer a mostly-affluent student body.

In particular, our findings coalesce with a growing enrollment management literature (e.g., [Bosshardt, Lichtenstein, Palumbo, & Zaporowski, 2010](#); [Burd, 2015, 2018](#); [Jaquette et al., 2016](#)) to suggest that many public research universities prioritize affluent, non-

meritorious, out-of-state students. Aside from a handful of prestigious universities (e.g., University of Michigan), most public research universities universities (e.g., University of South Carolina, University of Alabama) compete for out-of-state prospects who could not gain admission to flagship public universities in their home state. Indeed, many public research universities have adopted institutional “merit” aid programs that target out-of-state prospects with moderate academic achievement ([Burd, 2015, 2018](#); [Des-Jardins, 2001](#); [Leeds & DesJardins, 2015](#)). These students do not take advantage of the unique opportunities public research universities offer. Meanwhile, high-achieving, low-income students are often diverted to regional state colleges and community colleges ([Dillon & Smith, 2017](#)), which have lower resources and offer fewer learning opportunities than public research universities ([Kane & Orszag, 2003](#); [Winston, 2003](#)). This is not a meritocracy. As a consequence of the shift in enrollment priorities from merit to revenue, public research universities make diminished contributions to economic and civic development because they do not prioritize enrolling students with the most talent.

Policy efforts that focus solely on changing student behavior (the “demand side”) will fail to yield substantial increases in enrollment from under-represented student populations if they are not accompanied by policies that create incentives for universities to enroll these students (the “supply side”). For example, the under-matching literature has spawned a new population of “matching” organizations (e.g., Quest-Bridge, CollegePoint), which identify high-achieving, low-income students, reach out to these students and match them to selective colleges and universities which promise to provide four-year full scholarships. These organizations increase the “quality” of match

between students and colleges but there is no reason to believe that these organizations increase the total number of low-income students that selective institutions are willing to enroll.

State Policy

State funding and university enrollment priorities.

The transformation of enrollment priorities at public research universities is a response to a broken system of postsecondary education finance, led by state disinvestment in public universities. While state cuts to public research universities are often rationalized on the grounds that these organizations can generate alternative revenue sources ([Delaney & Doyle, 2011](#)), the unintended consequence is that universities respond by prioritizing students that generate the most net tuition revenue. [Jaquette and Curs \(2015\)](#) found that public research universities responded to state funding cuts by growing nonresident enrollment. Nonresident enrollment growth is not simply a function of enjoying excess demand and letting in more applicants; rather, our research shows that many universities aggressively incite nonresident enrollment demand by focusing recruiting efforts on out-of-state students.

Our results suggest a strong relationship between state support and university recruiting behaviors. Broadly speaking, universities with the least state funding tended (e.g., University of Alabama, University of South Carolina, University of Pittsburgh) focused recruiting efforts on out-of-state communities, visited relatively few in-state high schools, and exhibited socioeconomic and/or racial bias in in-state recruiting visits. CU-Boulder is a partial exception in that it receives no state funding, made more than twice as many out-of-state visits than in-state visits, but nev-

ertheless visited the majority of in-state public high schools and these in-state visits showed no evidence of racial bias. By contrast, universities with relatively generous state funding (e.g., NC State, SUNY-Stony Brook, University of Nebraska) tended to have best records of in-state coverage. However, several universities with generous state funding nevertheless made more out-of-state visits than in-state visits (e.g., SUNY-Stony Brook, University of Nebraska).

These findings raise important normative policy questions about public research universities and the public good. Should public research universities conceive of the public good in terms of serving the state – including the historic mission of social mobility for state residents – the nation, or the world? Or should public research universities focus on pursuing their self-interest (e.g., prestige, revenue generation) rather than providing value to society? However, statements about what the mission of public universities *should* be have little effect on organizational behavior. Rather, borrowing the old adage, “he who pays the piper calls the tune.” Our results suggest that if state policymakers want public research universities to prioritize access for meritorious state residents – particularly students from poor communities and communities of color – they must increase state funding.

Increased state support could come in the form of more generous state appropriations. Prior research finds that growth in state appropriations increases access by placing downward pressure on resident tuition price ([Koshal & Koshal, 2000](#)) which, in turn, positively affects student demand ([Hemelt & Marcotte, 2011](#)). On the supply side, more generous state appropriations enables universities to be less reliant on tuition revenue from affluent students, thus incentivizing universities to enroll more low-income students.

Increased financial support could also come in the form of more generous federal or state need-based grant aid programs, which also affects both student demand and university supply. Grant aid increases student demand by reducing net price paid. On the supply side, more generous need-based grant aid increases the purchasing power of low-income students, incentivizing universities to enroll more low-income students because these students now generate more net tuition revenue and require less need-based institutional aid. If federal and state policymakers are unwilling to increase need-based grant aid, income-share agreements (ISAs) are a non-governmental approach to increasing the purchasing power of poor students.

Substantially increasing state spending on higher education is a tough “ask” because state budgets face demands from many worth causes ([Kane, Orszag, & Gunter, 2003](#)) and because many states have enacted policies that make it difficult to raise taxes ([Archibald & Feldman, 2006](#)). However, recent midterm elections changed state legislatures and governors across the country. Perhaps these changes in state political environment – coupled with mounting evidence about the consequences of forcing public universities to rely on paying customers – will compel states to re-invest in public higher education.

Non-resident enrollment caps are another tool state policymakers can use to ensure that public research universities serve state residents. For example, public universities in North Carolina are subject to nonresident freshman enrollment cap of 18% of the freshman class and universities that violate this cap two years in a row are penalized through reductions in state appropriations ([General Assembly of North Carolina, 2009](#)). Following pressure from state legislators, the University of California (UC) System “voluntarily” capped

nonresident enrollment ([University of California, 2017](#)). Under this policy, nonresident enrollment is capped at 18% of undergraduate enrollment for campuses with less than 18% undergraduates in 2017-18, while campuses with more than 18% nonresident undergraduates in 2017-18 (Berkeley, San Diego, Los Angeles, and Irvine) cannot exceed their 2017-18 percent of nonresident undergraduates. Compared to other universities in our sample, NC-State, UC-Irvine, and UC-Berkeley focused recruiting visits on their home state, suggesting that non-resident enrollment caps affect university enrollment behaviors.

However, we argue that nonresident enrollment caps should be contractually tied to an agreement that the state provides sufficient funding. This way, the responsibility of public universities to serve state residents depends on state responsibility to provide adequate funding to pay for the costs of educating state residents. Without such an agreement, states may simultaneously defund public research universities and forbid them from replacing state funds with nonresident tuition revenue, thereby resulting in fewer resources per student and a lower quality of education ([Kane & Orszag, 2003](#)).

Aside from changes in state funding and nonresident enrollment caps, “percent plans” and “automatic admissions plans” are other policy levers to increase access at public research universities. Percent plans guarantee admission to some set of public universities for resident students who graduate near the top of their class (e.g., top 10%). Evaluations of percent plans – most of which draw from the Texas Top 10% Plan – tend to find that percent plans increase the probability of attending a public flagship university for high-achieving students from low-income schools and from majority-minority schools ([Arcidiacono & Loven-](#)

[heim, 2016; Fletcher & Mayer, 2014; M. C. Long, Saenz, & Tienda, 2010; Niu & Tienda, 2010](#)). More generally, automatic admissions plans – which include percent plans – guarantee admissions for students who meet specific academic achievement criteria (e.g., GPA and test score). [Cortes and Lincove \(2019\)](#), also drawing from the Texas Top 10% Plan, finds that guaranteed admissions plans increase the probability that high-achieving low-income students apply to and enroll in “high quality” universities.

Funneling students to community colleges. Many states have sought to increase baccalaureate attainment by growing community college enrollment and strengthening the transfer function ([Boatman & Soliz, 2018; Schudde & Grodsky, 2018](#)). In California, for example, legislators have pressured the UC system to enroll more community college transfer students ([Gecker, 2018](#)). Additionally, 20 states have adopted or are considering the adoption of free tuition programs at community colleges ([Campaign for Free College Tuition, 2018; Paterson, 2019](#)).

Although community colleges positively affect credential attainment and earnings of students who would otherwise not have attended postsecondary education (e.g., [Mountjoy, 2018](#)), empirical research unequivocally finds that they are a uniquely bad instrument for increasing BA attainment. 81% of first-time community college students aspire to obtain a BA ([Jenkins & Fink, 2016](#)). However, only 33% of degree-seeking students transfer to a 4-year university within six years ([Jenkins & Fink, 2016](#)) and only 14% of these students earn a BA within six years, compared to 60% of degree-seeking students who start at a 4-year university ([Jenkins & Fink, 2016](#)). This negative relationship is causal (e.g., [Doyle, 2009; B. T. Long & Kurlaender, 2009; Reynolds, 2012; Rouse, 1995](#)). The most recent, cutting-edge re-

search by [Mountjoy \(2018\)](#) finds starting at a community college rather than a 4-year university reduces probability of getting a BA by 18 percentage points (e.g., from a 50% probability to 32% probability). No other policy intervention to affect BA attainment approaches this level of magnitude.

Further, there are great socioeconomic and racial inequities in which students transfer to state flagship universities ([Dowd, Cheslock, & Melguizo, 2008](#); [Jenkins & Fink, 2016](#)). In California, a disproportionate number of transfers to the UC system completed a community college honors program. Students enrolled in community college honors programs have access to curricula, advising, and transfer opportunities unavailable to other community college students ([Cohen, Brawer, & Kisker, 2014](#); [Kisker & Outcalt, 2005](#)). For example, the UCLA Transfer Alliance Program (TAP) gives “priority consideration for admission to UCLA” to students who have completed an honors program at a “TAP member college” ([UCLA, 2019](#)). However, prior research finds that access to community college honors programs is racially and socioeconomically stratified ([Bulakowski & Townsend, 1995](#); [Byrne, 1998](#); [Laanan, 1998](#)).

Therefore, this policy trend of funneling BA aspirants to community colleges and pressuring public universities to enroll more transfer students begins to feel like a shell game designed to benefit all the players except low-income students and communities of color. Policy-makers can claim they are giving students an opportunity to obtain a BA, UC campuses can point to growth in community college transfers as evidence of their commitment to access, and community colleges enjoy enrollment growth. However, starting at a community college dramatically lowers the probability of obtaining a BA and the socioeconomic and racial inequities in access to community college honors programs suggest

that UC campuses are skimming the cream rather than providing opportunity to students who have faced the greatest obstacles to college access.

If state policymakers are serious about increasing BA attainment for under-represented students, they can no longer feign ignorance of the empirical fact that community colleges are terrible vehicles for BA attainment. Public policy to increase educational opportunity should not feel like the plot of an Ayn Rand novel. Rather, state policies should systematically funnel college-ready high school graduates with BA aspirations into 4-year institutions, a shift that would require investments in the enrollment capacity of public universities.

University Leaders

Although results indicate a relationship between state funding and university recruiting behavior, several universities facing similar environmental conditions exhibited substantially different recruiting patterns. For example, compared to UC-Berkeley, UC-Irvine did a much better job prioritizing low-income and majority-minority high schools in California despite receiving less state revenue per student than UC-Berkeley. Additionally, UC-Irvine made only 168 out-of-state visits compared to 421 by UC-Berkeley and out-of-state visits by UC-Berkeley were more focused on affluent, predominantly White high schools. These findings show that university enrollment priorities and recruiting behaviors are choices made by leadership rather than mere functions of the state external environment.

Recent research by [Dynarski, Libassi, Michelmore, and Owen \(2018\)](#) found that aggressive outreach combined

with the promise four years of free tuition and fees dramatically increased applications and enrollment at the University of Michigan by high-achieving, low-income state residents. These findings prove that public research universities can dramatically increase the enrollment of low-income state residents if they direct resources towards this goal. Therefore, the problem is not a lack of qualified low-income students. The problem is a lack of will by universities to enroll these students. While all public research universities espouse a commitment to access and equality of opportunity for state residents, our findings suggest that this commitment is largely a public relations effort for many universities. The time is now for university leaders to put their money where their mouth is rather than putting their money where the money is. Failure to do so will only strengthen the vicious cycle of state disinvestment, university disinvestment in state residents, followed by further state disinvestment as a response to universities no longer serving the state.

Additionally, public research universities should prioritize enrolling racially and socioeconomically diverse cohorts of state residents because of the consequences for campus culture. Compared to resident students, nonresident students are more affluent, are less likely to be Black or Latinx, and often have lower levels of academic achievement in high school (Jaquette et al., 2016). Further, recent growth in nonresident at public research universities students is associated with declines in the share of Pell recipients and underrepresented minority students (Jaquette et al., 2016). An extensive literature shows that low socioeconomic and racial diversity negatively affects that academic and social experiences of poor students and students of color (e.g., Fries-Britt & Turner, 2001; Hurtado & Ruiz, 2012; Oldfield, 2007; W. A. Smith, Allen, & Danley,

2007) and negatively affects learning outcomes for *all* students (e.g., Bowman, 2013; Gurin, 1999; Hurtado, Alvarez, Guillermo-Wann, Cuellar, & Arellano, 2012; Park, Denson, & Bowman, 2013). Armstrong and Hamilton (2013) show that enrolling large cohorts of affluent, predominantly White students with mediocre records of academic achievement create a campus culture where first-generation college students are chastised for trying hard in class and socially ostracized for their lack of financial resources. Considering the growth in "merit" aid for out-of-state students with mediocre academic achievement (e.g., Burd, 2015, 2018; Leeds & DesJardins, 2015) and our finding that most universities concentrate recruiting efforts on affluent, predominantly White, out-of-state communities, we argue that university enrollment management behaviors are explicitly creating a campus culture that is hostile to poor students and students of color.

Finally, university leaders genuinely concerned about access should make this priority clear to enrollment managers and play a role in the implementation of enrollment management policies. Several university presidents and trustees who read our New York Times op-ed [LINK] about off-campus recruiting expressed surprise when confronted with the recruiting patterns of their university. These anecdotes suggests that trustees and presidents set broad enrollment goals and delegate the achievement of these goals to enrollment management offices and the consulting firms they hire. Enrollment managers may conclude, for example, that the most effective means of satisfying orders from above is targeting affluent out-of-state high schools and pursuing racial diversity by visiting magnet schools but ignoring traditional public schools in communities of color. Therefore, university leaders must consider how broad enrollment goals create

behavioral incentives for enrollment management offices.

Advocacy and Future Research

Although we initiated research on university recruiting behavior with the goal of shifting national policy debates about access inequality, an unanticipated effect is that a handful of local actors (e.g., at Emory University, University of Colorado-Boulder) began using our data to initiate discussions with university leadership about enrollment priorities and recruiting behaviors. These unexpected anecdotes helped us envision a new theory of change, one that operates at the local organization-level rather than the macro policy-level.

All public universities have local constituents – both internal and external to the organization – who care about access and demand that university leaders place a higher priority on access. Consistent with findings from broader literatures on organizational behavior (Davis, 2005), universities typically respond to stakeholder demands with lofty rhetoric and by adopting new policies or programs (e.g., holistic admissions, “no loan” tuition policies, “outreach” efforts) (e.g., [The White House, 2014a](#)). Often, stakeholders cannot determine whether these responses are earnest or ceremonial. Without concrete evidence that an organizational response is symbolic, stakeholders feel compelled to accept the organizational response and demands for change lose energy

Therefore, our theory of local change is to empower access advocates by collecting concrete, quantifiable data about university recruiting behaviors. These data yield insight about whether university commitments to access are earnest or ceremonial. Since the

data we collect are public, we can release these data to the public. In turn, access advocates can present these data to university leadership when demanding stronger action on access. Armed with systematic data about university recruiting behavior, access advocates will no longer be pacified by lofty rhetoric or opaque programs with unclear resources. Therefore, these data provide the foundation for debate about what the university actually does rather than a debate about what the university says it does.

While off-campus recruiting encompasses only one facet of university recruiting efforts, presenting concrete data to university leadership raises the bar for what counts as evidence and shifts the burden of proof to the university. If university leaders claim other recruiting efforts (e.g., “outreach,” direct mail) target populations ignored by off-campus recruiting, access advocates can demand concrete, data about these efforts. If leadership cannot produce these data, there is no reason to believe that inequities observed in off-campus recruiting visits are unrepresentative of other recruiting efforts.

We hope that our data on recruiting behavior is utilized by both internal and external stakeholders concerned with access. Offices of diversity, equity, and inclusion are particularly well positioned; these offices are charged with creating an inclusive campus climate but our data shows that university recruiting behavior is often antithetical to the representational diversity necessary for an inclusive campus climate. Other potential internal stakeholders include faculty senates, student groups, and board of trustee members. The power of an external stakeholder to demand change is a function of university dependence on resources controlled by the stakeholder ([Pfeffer & Salancik, 1978](#)). From this perspective, universities are particularly sen-

sitive to demands from donors and from elected officials who control public funding and policies that regulate university behavior. Alumni are often well-represented on internal and external committees that have authority over university actions. Additionally, journalists, community organizers, and non-profit organizations have capacity to inform public opinion and influence elected officials.

Finally, researchers create an empirical basis for local and national policy debates by collecting, analyzing, and disseminating data. Our research on off-campus recruiting stands on the shoulders of giants, particularly groundbreaking scholarship sociologists (e.g., [Holland, 2019](#); [Khan, 2011](#); [Stevens, 2007](#)). These studies tend to broad in scope – e.g., encompassing the recruiting, admissions, and yield process – and are based on qualitative, ethnographic, and archival data from one or two organizations. By contrast, our research collects quantitative data on one facet of university recruiting from a larger number of organizations. A limitation of our research is that we ignore many recruiting interventions utilized by universities because collecting systematic data about one recruiting intervention is so time-intensive. However, policy debates tend to be swayed more by quantitative data from many organizations than qualitative data from one organization. Therefore, we see great potential to inform policy debates by developing a set of successive studies, each collecting systematic, quantifiable data about a particular recruiting intervention. Over time, this research agenda will encompass the breadth of university recruiting behavior.

We have initiated several new data collections to capture the different means universities utilize to identify and target prospects. For example, we are using public records request to examine which student character-

istics universities prioritize when purchasing the contact information of “prospects” from College Board and ACT. Second, following [Hanson \(2017\)](#) and [Thornhill \(in press\)](#), we are developing experimental audit studies to examine how universities respond to “inquiries” from prospects with different characteristics? Third, to what extent are university “outreach” and “pipeline” efforts marginal versus substantial in scale? For each of these data collections, we intend to make the results publicly available so that stakeholders can use these results to push for change at their local university. We also plan to publicly release all data we collect so that researchers and non-profit organizations can conduct their own analyses.

Other important questions about university recruiting behavior require qualitative analyses. For example, how do universities decide which schools and communities to visit and what role do enrollment management consulting firms play in this process? What difficulties do universities face when attempting to visit schools with fewer resources to host admissions visits and how have military recruiters and for-profit colleges been able to overcome these difficulties? Which prospective students are targeted by social media efforts and paid advertising?

Our hope is that a critical mass of scholars and policymakers become interested in university enrollment management behaviors. Once this happens, policy debates about access will shift from a focus on student “deficiencies” towards a focus on university enrollment priorities. In turn, policy debates will consider solutions to reduce biases in university enrollment priorities.

APPENDIX

FIGURE A1: STATE REVENUE AND TUITION REVENUE PER FTE STUDENT, 2003-04 THROUGH 2016-17.

Data Sources: IPEDS 12-Month Enrollment Survey; IPEDS Finance Survey

Variable Definitions: FTE student count is based on reported full-time equivalent undergraduate enrollment; State revenue is the sum of state appropriations, operating grants and contracts, and non-operating grants; Tuition revenue is defined as revenue from tuition and fees after deducting discounts and allowances

FIGURE A2: PERCENT OUT-OF-STATE FRESHMEN AND FEDERAL GRANT RECIPIENT, 2003-04 THROUGH 2016-17.

Data Sources: IPEDS Fall Enrollment Survey; IPEDS Student Financial Aid Survey

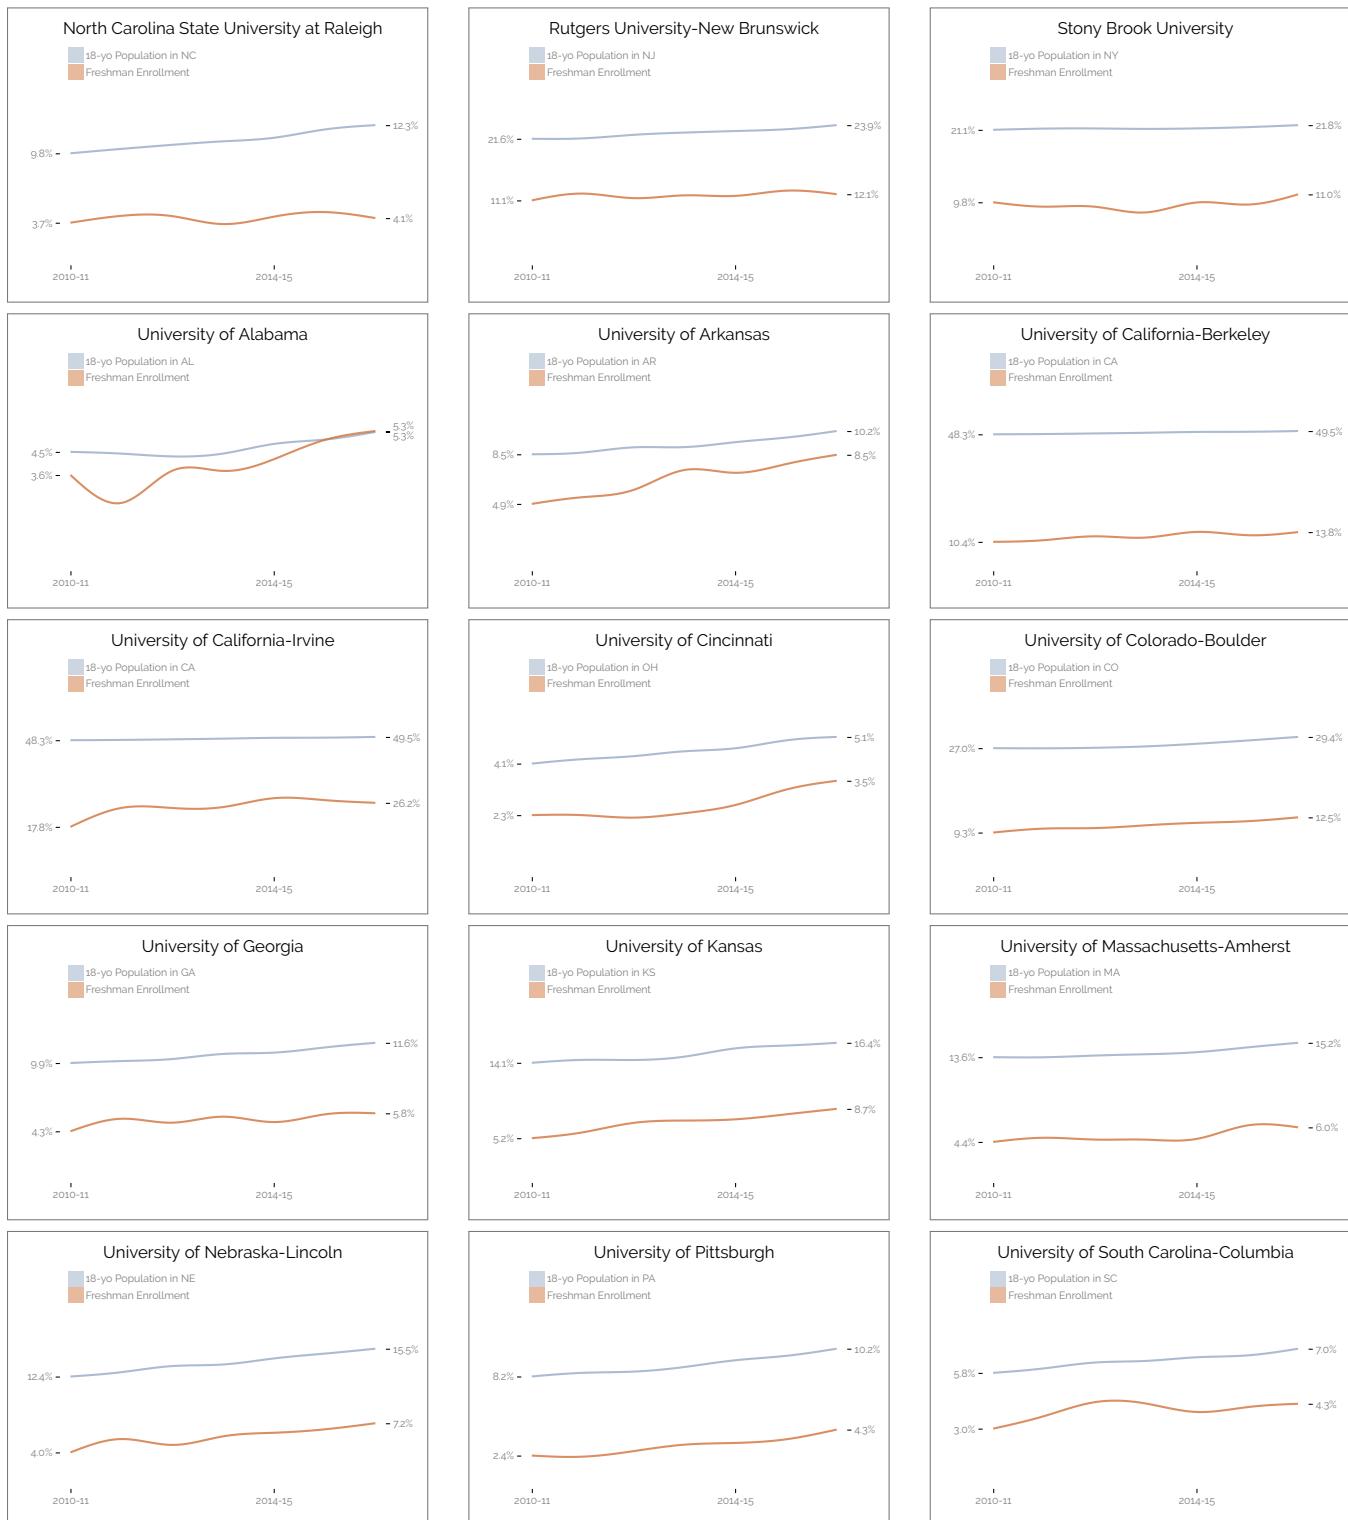

Variable Definitions: Percent out-of-state freshmen is calculated for first-time degree-seeking undergraduate students based on state of residence at time of admission; Percent federal grant recipient is defined as percent of full-time, first-time degree-seeking undergraduates in full-year cohort who are awarded federal grant aids

FIGURE A3: PERCENT BLACK 18-YO IN-STATE AND FRESHMEN ENROLLMENT, 2010-11 THROUGH 2016-17.

Data Sources: NIH National Cancer Institute; IPEDS Fall Enrollment Survey

Variable Definitions: Freshmen enrollment is defined as full-time and part-time first-time students

Note: NIH race categories are defined by origin (Hispanic, Non-Hispanic) and race (White, Black, American Indian/Alaska Native, Asian/Pacific Islander), while IPEDS categories include White, Black, Hispanic, Asian, Native Hawaiian/Pacific Islander, American Indian/Alaska, two or more races, unknown races, and nonresident alien; We count all race categories in the total when calculating the percentage for each data source

FIGURE A4: PERCENT LATINX 18-YO IN-STATE AND FRESHMEN ENROLLMENT, 2010-11 THROUGH 2016-17.

Note: We use the term "latinx" to refer to the population of hispanic origin

FIGURE A5: NUMBER OF HIGH SCHOOL GRADUATES IN STATE, 2000-01 THROUGH 2019-20.

Data Sources: Western Interstate Commission for Higher Education

Variable Definitions: High school graduates may include graduates from any point of each academic year, from fall through the summer

Note: Private high school data is only available on a biennial basis; Projected data for private high schools start from 2015-16 on and are produced based on data up to the 2010-11 academic year
